Demystifying the Computer Science PhD Admission in the US

ThanhVu (Vu) Nguyen

George Mason University, Dept. of Computer Science

February 28, 2025 (latest version available on [Github](#))

Preface

Having been involved in PhD admission committees for many years, I’ve observed that **international students**, especially those in smaller countries or less well-known universities, often lack a clear understanding of the Computer Science PhD admission process at US universities. This confusion not only discourages students from applying but also creates the perception that getting admitted to a CS PhD program in the US is difficult compared to other countries.

So I want to share some details about the admission process and advice for those who are interested in applying for a **PhD in Computer Science in the US**. Originally, this book was written for international students, but has been expanded to include information for **US domestic students** (§C). Moreover, while this primarily aims at students interested in CS, it might be relevant to students from various STEM (Science, Technologies, Engineering, and Mathematics) disciplines. Furthermore, although many examples are specifics for schools that I and other contributors of this book know about, the information should be generalizable to other good R1¹ institutions in the US.

This information can also help **US faculty and admission committee** gain a better understanding of international students and their cultural differences. By recognizing and leveraging these differences, CS programs in the US can attract larger and more competitive application pools from international students.

I wish you the best of luck.

This book is open source and available at

dynaroars.github.io/phd-cs-us/demystify.pdf,

and its L^AT_EX source is also on [GitHub](#). If you have questions or comments, feel free to create new [GitHub issues](#) or [discussions](#).

¹An [R1 institution](#) in the US is a research-intensive university with a high level of research activity across various disciplines. Currently, 146 (out of 4000) US universities are classified as R1.

Contents and Summary

I	Introduction	1
1	Should You Apply?	2
	<i>Yes, definitely. CS PhD study in the US is often fully funded and admission into good universities in the US is not any harder than in other countries.</i>	
1.1	Who is this handbook for?	3
	<i>This book is intended for international students from smaller countries and domestic students from less well-known universities.</i>	
1.2	How long to complete the CS PhD program?	3
	<i>About 5–7 years in the US.</i>	
1.3	My undergrad was not in CS or related areas	4
	<i>You can successfully apply to CS PhD even if you have non-CS background.</i>	
1.4	Is MS required for admission to PhD in CS?	5
	<i>You do not need an MS to do PhD in CS.</i>	
1.5	PhD in the US vs. Other Countries	5
	<i>Among several differences, CS PhD in the US does not require an MS degree but has a longer PhD study time.</i>	
2	How is Your Application Evaluated?	8
	<i>Applications are evaluated by the PhD Admission (adcom) committee and each application is typically reviewed by three faculty members.</i>	
2.1	Admission Committee (Adcom)	8
	<i>Adcom members are faculty who evaluate your application. They consider various factors, e.g., research experience, LoRs, SOP</i>	
2.2	How applications are assigned to adcom members?	9
	<i>Adcom members only review applications assigned to them (typically matching their expertise) and rarely get involved in other applications</i>	
2.3	How are decisions made?	9
	<i>Even if all adcom reviewers recommend acceptance, the application can still be rejected. Vice versa, if all reviewers think the application is weak, the student might still be admitted.</i>	
2.4	Do adcom members talk to each other?	10

Sometimes adcom members discuss applicants, but in most cases they make independent decisions.

2.5	Waiving the application fee	11
-----	---------------------------------------	----

II Application Materials 12

3 Letters of Recommendation (LoR) 14

*LORs are very important, but only if they are **personalized** and **research focused**.*

3.1	LoR writers	14
-----	-----------------------	----

LoR writers should be someone who (i) can talk in depth about your research experience and potential and (ii) have the credibility to evaluate your research ability.

3.1.1	LoR from Well-Known People	15
-------	--------------------------------------	----

3.1.2	LoRs from Dept Chair, Dean, or Boss and Supervisor at Work	15
-------	--	----

3.1.3	Generic Letters are Bad	16
-------	-----------------------------------	----

3.1.4	Self-written Letters are Bad	17
-------	--	----

3.2	Asking for LORs	17
-----	---------------------------	----

Ask for LoRs at least a month before the deadline. Waive your right to see the letter. Help your writers by providing details about your research experience and potential.

3.2.1	Waiving Your Right	18
-------	------------------------------	----

3.2.2	Helping your LOR Writer	18
-------	-----------------------------------	----

3.2.3	Reminding Your Writers	19
-------	----------------------------------	----

3.2.4	Thank Your Writers	19
-------	------------------------------	----

3.2.5	How is a LoR written? Is it lots of work?	19
-------	---	----

4 Research Experience 22

*Publications are not **required** but can **greatly help**. Papers in good venues are concrete evidence that you have successfully engaged in research.*

4.1	Publications	22
-----	------------------------	----

4.2	Work Experience	24
-----	---------------------------	----

4.3	Competitions	24
-----	------------------------	----

5 Statement of Purpose (SOP) 25

*SOP is important. Write it in such a way that makes you **stand out**.*

5.1	Kiss of Death in SOP	26
-----	--------------------------------	----

5.2	Diversity Statement	27
-----	-------------------------------	----

6 Your School and Grades 29

High grades probably won't help much, but bad ones likely will raise concerns.

6.1	School	29
-----	------------------	----

CONTENTS AND SUMMARY	5
6.2 Grades	30
7 Standard Tests (GRE and IELTS)	32
<i>Standard tests are not important. GRE typically is not required. For standard English tests (not required for domestic students), just do enough to pass the minimum requirements.</i>	
7.1 GREs Are Optional and Do Not Matter for PhD Admissions	32
7.2 English Tests (IELTS, TOEFL)	32
8 Miscellaneous	34
8.1 CV	34
<i>Highlight and summarize major achievements such as major publications and competitive programming awards.</i>	
8.2 Writing Sample	34
8.3 Online Courses and Certificates	35
III After You Apply	36
9 Interview and the Waiting Game	37
<i>Getting an interview is typically a good sign; but no interview does not mean rejection.</i>	
9.1 Interviews	37
9.2 Not Getting Interviews	38
9.3 Notification Timeline: Why rejection letters are sent so late?	39
<i>Grad programs often wait for accepted students to make their decisions, typically by April 15, before sending out rejection letters.</i>	
10 Getting Admitted	40
<i>Congrats! Now it is your turn to evaluate the school! Attend Open House to learn more about the place and interview profs—they would be much more willing to talk to you now.</i>	
10.1 Checking Status, Accepting, Postponing, and Decline Offers	41
10.2 Negotiating PhD offer (e.g., having multiple offers)?	42
<i>You will not be able to negotiate stipend, but you can ask for specific start date, TA assignment, and conference travel budget.</i>	
10.3 Buying Computer Equipment	43
<i>Ask your prof. if they can buy computer equipment and such for your research.</i>	
11 Dealing with Rejection	44
<i>Rejection is part of academia. Common reasons for rejection include aiming too high, not a good fit, and bad luck. Do not take rejection personally. Learn from it and try again.</i>	

11.1 Try Again!	44
11.2 Why did you get rejected?	45
You aim too high, are overqualified, or even because you applied to AI/ML, a super competitive field in recent years with many applicants.	
11.2.1 Your profile is not as strong as you think	45
11.2.2 Other Common Reasons for Rejection	45
11.3 Increasing your admission chance	47
You can improve your profile by being unique and standing out.	
 IV Funding, Schools, and Profs.	 48
 12 Funding	 49
<i>TAs, RAs, and fellowships are main funding sources for PhDs. TAs are provided by the department to help with classes. RAs are given by profs. to help with their research. Fellowships, provided by the university, department, or external sources such as government or industry, give more flexibility but can be very competitive.</i>	
12.1 Graduate Assistantship (TA/RA)	49
12.1.1 Teaching Assistant (TA)	50
12.1.2 Research Assistant (RA)	51
12.2 Fellowships/Scholarships	51
12.3 Miscs	52
12.3.1 Low Stipend?	52
12.3.2 Funding In the Summer	53
12.3.3 How much do you cost?	53
Your entire PhD program costs about \$400K in total, but you <i>do not</i> pay for it.	
 13 Choosing Schools	 56
<i>Not every university has a CS PhD program. Not every professor, even those in CS, can advise or graduate CS PhD students.</i>	
13.1 Choosing a University	56
<i>Select schools based on their CS program and faculty research interests.</i>	
13.1.1 Schools offering PhD in CS	56
13.1.2 Selecting and Ranking Schools	57
13.1.3 PhD in other related fields: CE, IST, Cybersecurity	58
 14 Choosing an Adviser	 59
<i>The best adviser is the one that you can work well with. But you do not know that until you start working with them.</i>	
14.1 Finding an Adviser	59

14.2 Who can serve as a PhD adviser?	60
14.3 Tenured or tenure-track faculty?	62
14.4 Research Achievements	63
14.5 Contacting a Prof. How to get a desired reply?	66
<i>Individually faculty member cannot directly admit a student—so do not email and ask if you have a chance. However, faculty can advocate for a student and therefore increase their admission chance—so contact and introduce yourself.</i>	
14.5.1 Kiss of Death in Emails	68
14.5.2 Interpreting Response	69
14.5.3 Are profs. so busy that they completely ignore emails?	70
V Miscs and FAQs	71
15 Miscs and FAQs	72
15.1 “Chance me” on getting admitted to T10 programs	72
15.2 How long does it take to evaluate an application?	73
<i>It takes me about 10–15 minutes to review an application.</i>	
15.3 Checking for AI in SOPs	74
15.4 How to call or address a professor?	75
<i>What should you call your profs.? Many possibilities (e.g., prof., Dr., and even their firstnames), but not Mr., Mrs., or their firstname in the first email.</i>	
VI Appendices	77
A Glossary	78
B Visa for International Students	82

Part I

Introduction

Chapter 1

Should You Apply?

“Don’t make fun of graduate students. They just made a terrible life choice.”

THE SIMPSONS

International students, especially those from less well-known universities and smaller countries, often wonder if they should apply to a CS PhD program in the US. Common concerns include (i) the **difficulty of getting admitted** and (ii) the **cost of graduate study** in the US.

Much of these uncertainties stem from the lack of information and guidance on the admission process in the US. Social platforms like Facebook and Reddit are full of confusion and contradictory information. This book aims to address these concerns.

Not any harder than other countries Applying to a good US university *should not* be any harder than at schools in other countries. It might even be more flexible since CS PhD in the US *do not* require having an MS or a research topic, proposal, or adviser in advance (§1.5 compares CS PhD study in the US to other countries). It doesn’t even require having a CS background (§1.3). If you believe you have a chance in other countries, e.g., South Korea, Singapore, Germany, UK, Japan, and Australia, then you will surely have a chance in the US as well.

Funding is not an issue PhD students in CS *do not* need to worry about funding, especially at good R1 universities in the US. If you are admitted, you will almost certainly receive *full funding* (§12) to support your study. This includes tuition, health insurance, and stipend (i.e., in STEM field you get paid for your study!). For many students, the stipends provided are not only sufficient to cover your own living expenses but also enough to support your families (e.g., spouse and children), allowing them to live comfortably.

Moreover, you often receive additional benefits such as summer pay (§12.3.2),

laptops (§10.3), and traveling to conferences and workshops. Full funding for CS PhD students is the norm in the US, and I’d go as far as to say that if you are not admitted with full funding, you might want to not accept the offer.

1.1 Who is this handbook for?

While this book can be useful for all students, it would most benefit **international students** from **smaller countries and less well-known universities**. It is also useful for **domestic students** from US universities with **no PhD programs or limited research opportunities**.

Students from top schools with strong research programs and experience might already know most of the information given here. They likely have received guidance from their professors or grad students who have gone through the process. Students from smaller schools or countries, however, might not have access to such resources and know where to start. My goal is thus to level the playing field by providing info that is not readily available to less privileged students. I hope to encourage more students with such backgrounds to apply and succeed in CS PhD programs in the US.

This book also aims to explain the **reasons behind the admission process**. There are numerous [resources online](#) that tell you “*what*” to do, but few explain the “*why*”, e.g., why LoRs matter so much, why you should not draft your own LoR, why you should contact professors, etc. Understanding the reason and mindset of the admission committee and profs. can help you prepare better.

1.2 How long to complete the CS PhD program?

Typically, it takes 5–7 years for CS PhD in the US. This can be longer compared to other countries (§1.5), which might require MS (§D.1) first.

The first two years you typically take coursework (somewhat equivalent to an MS study), find an adviser, and learn how to do research. The next 2–3 years you focus on your research, form a dissertation topic, and get results published. The last 1–2 years you continue to publish, write and defend your dissertation, and look for a job. Within these 5–7 years, CS PhD students often take a “leave of absence” for 1–2 semesters or summer to do internships at companies and research labs.

Vu: I start my PhD with an MS, and it took me 7 years (Fall’07– Fall’14). I spent half a year doing an internship at the Naval Research Lab. My PhD did take a bit longer than usual, but allows me to explore various research areas and topics.

Fig. 1.1: The “ambition” level of a PhD student over their years of study (they miss the 6–7th year when the ambition is “*Just let me graduate*”).

1.3 My undergrad was not in CS or related areas

You still can apply to PhD in CS *as long as* you can demonstrate you are ready for it through your background, research experience, LoRs, statements, etc. You might be even able to leverage this to make your profile stand out as mentioned in §11.3.

A main question adcom (§2.1) has for a non-CS or non-STEM student is if you have the sufficient technical background obtained through core CS courses. So you need to show that you have such knowledge through your coursework, projects, or research. For example, if you have taken a course on Algorithms, even online ones like Coursera, you can talk about it in your SOP. If you have done a project that requires knowledge of OS or have a professional certification (e.g., A+) through work, you can talk about it. If you have done research that requires knowledge of Discrete Maths, you can talk about it. You can also ask your LoR writers to talk about your technical background. In summary, in your application, convince us that you have the background to do CS PhD research.

Core CS topics Common CS knowledge that you should know are:

- Programming Foundation (e.g., programming concepts in some modern languages)
- Discrete Math (e.g., logic, set theory, proof techniques)
- Data Structures and Algorithms (e.g., linked lists, trees, sorting, searching)

- Computer OS or Systems (e.g., memory management, file systems, processes)

In short, you *do not need* to formally take CS courses, you just need to show that you have this essential knowledge, e.g., through the mentioned ways. Many universities are well aware that incoming graduate students might not have all the technical background, so they often have a “*bridge*” courses to help students catch up. For example, Mason has four bridge courses corresponding to the four core areas above that incoming students can take to catch up on their CS knowledge.

Vu: I would advocate for a non-STEM student who shows that they have a strong drive for CS by studying core CS knowledge through various channels (e.g., self-study through online courses, projects, etc.). I have seen many students with non-CS backgrounds who are very successful in CS PhD. I also have seen many students with CS background who are not successful in CS PhD. So it is not about your background, it is about your drive and passion for CS research.

1.4 Is MS required for admission to PhD in CS?

No, while other countries often require an MS for PhD student in CS (§1.5), it is common in the US to apply for a PhD program directly after a 4-year undergrad program (e.g., after getting a B.S degree). Most CS PhD programs are designed so that students can get MS degree “along the way” to PhD, e.g., after finishing the 2-year course work.

However, MS can help admission if it gives research experience or is from a more well-known school than your undergrad institution (§6). Moreover, if you have an MS then some course work *might be* transferred for course credits, which *might* save some time. But in general don’t count finishing earlier just because you have an MS.

Vu: I start my PhD with an MS in CS from a US university. I found that the MS helped me in gaining research experience, but I still had to retake courses because I did my MS at a different university. So in the end, I did not save any time because of the MS.

In general, don’t worry if you don’t have an MS. But also don’t feel that you wasted your time if you have an MS, as it can help you in research.

1.5 PhD in the US vs. Other Countries

Tab. 1.1 summarizes the main differences between CS PhD in the US and other countries. Note that these differences can vary by institution and country. Some countries might have a PhD program that is similar to the US. The following are some common differences:

MS requirement and PhD duration: CS PhD programs in the US do not require an MS degree (as mentioned in §1.2 and §1.4). In contrast, many other countries

Tab. 1.1: Comparison of the CS PhD program in the US and other countries

Aspect	US PhD Programs	Other Countries
Duration	5-7 years	3-5 years
MS Required	Not required	Often required
Coursework Required	Yes (first 2 years)	No
Research Proposal Required	No	Yes (in some countries)
Academic (Faculty) Job	Direct	Postdoc
Work Life Balance	Less	More

require having an MS degree before joining a PhD program. This means that US PhD programs are longer (5–7 years, 2 of which are coursework) than other countries (3–4 years, no coursework).

Project proposal: in many countries, you have to choose a project and adviser *during* the application process (e.g., you write a proposal to a potential adviser). But this allows you to start your research right from the beginning.

In the US, you often start your PhD without an adviser or project and find them later. Usually you have two initial years to take classes, explore and find an adviser and research topic.

Course work: In the US you will spend the first couple of years taking classes and exploring potential adviser and research topics. After that, you have to pass a series of exams during your PhD, e.g., qualifying exam, comprehensive exam, thesis proposal defense¹.

In other countries, you often start your research right away and work on the research project you proposed with the adviser you chose. Moreover, you might not have exams like those in the US or only have to do a few of them.

Funding: In many countries, funding comes from the university or the gov’t. This funding often has a fixed duration, e.g., 3 or 4 years. In the US (§12), funding (e.g., RA) comes directly from your adviser (no fixed duration). There are also fewer TA opportunities in European universities compared to the US.

Academic position after PhD: In other countries, PhD graduates interested in academia typically apply for additional research appointments, i.e., postdocs, and then consider faculty positions.

In the US, PhD graduates often apply directly for faculty positions. Postdoc for US graduates is no longer a popular option as it was before.

Work-life balance: PhD students in the US are often said to be overworked compared to other countries, e.g., in Europe. This is partly due to the longer PhD program and that US PhD students are often paid through TA, which requires them to do TA in addition to their own research. In contrast, PhD students in other

¹ABD (all but dissertation) refers to a PhD candidate who has finished all course work and exams and only needs to write and defend their dissertation.

countries are often paid through fellowships, which might not require doing TA.

Chapter 2

How is Your Application Evaluated?

After you submit your PhD application, it will first be checked for general requirements, e.g., did you submit your transcripts and standard scores? Usually, this screening process is done through a central university system, i.e., not by CS faculty.

After screening, your application is complete and forwarded to the CS department for further evaluation. If you don't pass screening, the system will tell you what is missing and what you need to do. So pay attention to your email and check your application status regularly.

Hakan: At Mason, for full consideration, students should make sure to submit **ALL** required documents by the application deadline, and should never assume that some required documents (such as official TOEFL scores or official diplomas/transcripts) will be waived by the admissions office. If something is listed and not marked as “optional”, it is mandatory and they should plan for submitting all those.

2.1 Admission Committee (Adcom)

Your applications are reviewed by a PhD admission committee or *adcom* that consists of faculty members in CS¹. Adcom members have a wide range of expertise and background to ensure diverse perspectives in the evaluation process. The size and the review load of the adcom depend on the department size. At Mason, the PhD adcom typically has 15–20 faculty, and each committee member is assigned to review about 30 applications. Note that most large schools, including Mason, have separate adcoms for MS programs (§D).

The PhD adcom typically involves assistant professors in the department (see §14.2 for various types of faculty). This provides junior faculty the opportunities

¹In some cases the committee can involve affiliated faculty from different disciplines.

to recruit students. The adcom *chair* will likely be a senior faculty, but they will not review individual applications and instead assign them to committee members. The chair will look at various factors such as research interests or mentioning faculty names to assign the applications to appropriate faculty, e.g., I am often assigned to review applicants interested in software engineering.

Each application is assigned to about three adcom members, who will evaluate your profile and reach a consensus. They will consider various factors, e.g., research experience, GPA, LoRs, SOP, test scores, and interviews. More details about these factors are discussed in [Part VI](#).

Vu: At Mason, we usually decide that a full-time PhD candidate is either (i) admitted with funding ([§12](#)) or (ii) rejected. In other words, in most cases, we either admit you with full funding or reject your application. In some rare cases, we admit without funding because you have funding on your own, e.g., supported by your government or having external fellowships. We justify our decision ([§15.2](#)) with a summary of your application, where we list strengths, e.g., came from a well-known school, and weaknesses, e.g., weak and generic LoRs.

2.2 How applications are assigned to adcom members?

While adcom members (in fact, any faculty) can view any application, we only review those that are assigned to us, which are already too many. Adcom chair will assign applications to reviewers based on their expertise (e.g., if a student says they want to do SE or interested in working with me), and reviewers will only review those applications. Occasionally we might look at other applications, e.g., if we know the student or have some special circumstances (e.g., if that student contacted me, I know that student, they are from Vietnam, etc). However, even if we look at them, we usually do not get involved in their evaluation.

Note that while the assigned reviewers are the main ones deciding your application, other faculty in the department can also have access to your application and provide inputs and opinions on your profile. Thus, it helps to contact faculty ([§14.5](#)) and mention faculty you're interested in in your SOP ([§5](#)).

2.3 How are decisions made?

After reviewers have evaluated an application, adcom chair will review all evaluations, look at entered notes, and ask reviewers to discuss and resolve discrepancies to reach a consensus (e.g., a reviewer wants to accept but the other wants to reject). Typically, the decision is made entirely by the reviewers; there is no involvement from the adcom chair, department chair, or others. In most cases adcom members, even those reviewing the same application, make decisions independently and do not

talk to each other (just a common practice to avoid biasing). In some rare cases we might (§2.4).

Even if *all* reviewers recommend acceptance, the application is not automatically accepted, especially if no faculty is willing to advise the student. For example, if the student is interested in a research area that no faculty is working on, or an area where no faculty is taking new students (e.g., AI/ML where faculty likely already has many students) then the student will not be admitted. This is increasingly common as the number of applicants grows much faster than the number of available faculty. Note that not every CS faculty can formally advise and graduate CS PhD students (§14.2).

However, if the student has contacted a faculty member and that faculty is interested in the student and has made this known to the admission committee, then the student is likely to be admitted, *even if the faculty does not review the application or has funding* (thus the benefit of contacting faculty as discussed in §14.5).

Similarly, if the student mentioned a faculty in their SOP, adcom might ask that faculty to look at their application and if they are interested in the student. Even if the student has a weak profile (but still passes the minimum requirement from the university), they might be admitted if a faculty is willing to take them. Adcom members, especially in the US, are very reluctant to go against the faculty's decision (e.g., if a faculty wants to admit a student, we are not going to reject them).

2.4 Do adcom members talk to each other?

We typically review applications independently and do not talk to each other. This is to avoid biasing, e.g., if one reviewer says they want to accept, the other might feel pressured to accept as well.

However, when there are discrepancies in evaluations, the adcom chair will ask reviewers to discuss the application to reach a consensus. We might also talk to each other for interesting or strong applications, e.g., how to recruit this student or who should be the adviser. If the student mentioned a faculty member in their SOP, we might ask that faculty if they are interested in the student.

Note that other disciplines might have different practices, e.g., they might select a top list of applicants and then discuss them in a meeting to determine who to interview. In CS, both the reviews and interviews are often done independently (§9.1).

From a prof. in Physics at an R1 university: We have a pretty well fleshed out grading rubric for applications that has categories like grades, research, writing ability, etc. I would say our rubric is weighted about 1/2 on academics (research, LORs, grades) and 1/2 on the idea of “grit” or “resilience” (engagement, leadership, working through obstacles).

The rubric helps a lot to standardize how committee members grade, and speeds things up a bit because you know what to look for. We spent what seemed like forever on the details of the grading system (e.g., what does a score of ‘3’ vs a ‘2’ in writing look like?) but now it’s very helpful.

We also do roughly three rounds of selection: a first “triage” round to determine the top 100 applications, a second round to determine about 25 people to interview, and then a third round to decide the actual offers. That also helps to speed things up a bit, since in the first round with all the applications you can move fairly quickly since you just need to sort into “good” and “bad”. By the time we’re getting into the details and reading everything more closely in rounds 2 and 3 most of the applications have been removed from consideration. So for this method I do maybe 5 minutes per app in round 1, but closer to 20 minutes per app in round 2, and usually round 3 is long discussions about specific people.

2.5 Waiving the application fee

Some universities do waive, e.g., Rice, TTIC do not have fee for PhD applications and many universities for domestic students (§C). Some programs also waive if the applicants attend some of their opening sessions. Some programs waive if the applicant provide proof of financial difficulties, e.g., a statement from a financial adviser or a bank statement.

However most do not waive the application fee, which is typically a requirement of the university. Individual departments and programs do not have the flexibility to waive the application fee, even if they want to.

Vu: In my opinion, requiring applicants to pay the fee helps ensure their seriousness, as it filters out non-serious candidates. Most CS programs already receive many applications and would be overwhelmed if the application process were free. Even with application fee the competition is already very tough, imagine if the application is free and the number of applications triples or quadruples.

Note that if you have financial difficulties, you can ask the department for a waiver, but this is typically only granted in exceptional cases.

Part II

Application Materials

*“Son, if you really want
something in this life, you have
to work for it. Now quiet!
They’re about to announce the
lottery numbers.”*

THE SIMPSONS

The goal of adcom is to evaluate your research experience, potential, and interest to see if you **fit into its PhD program!** The emphasis here is *fitting*, which varies from school to school, faculty to faculty, and even from year to year. The committee will look at various factors, but the most important ones are letters of recommendation (LORs), statements of purpose (SOP), and research background and experience, e.g., publications.

Chapter 3

Letters of Recommendation (LoR)

*“To whom it may concern...
D’oh!”*

THE SIMPSONS

Most PhD programs will require at least *two* letter of recommendations (LoRs). The goal of the LoRs is to provide the adcom with an assessment of your research ability from someone who knows about research and *you* well. The LoRs should focus on your research background, achievements, and potentials, all of which paint a compelling picture of you as a researcher to adcom.

3.1 LoR writers

LoR writers should be someone who (i) can talk in depth about your research experience and potential and (ii) have the credibility to evaluate your research ability.

A LoR writer should be someone who *knows you well*, so that they can provide a strong-supporting and personalized letter for you. LoR writers should also *have the credibility* to convince adcom members on your research ability and potential. Such a person is typically someone who has a PhD, so they know what a PhD is about and so can evaluate your research ability. LoR writers are often your research advisers, professors, or supervisors who have worked with you on research projects.

3.1.1 LoR from Well-Known People

Having a strong letter from an internationally recognized researcher can *greatly strengthen* your application. Such a letter can outweigh the lack of publications (or low GPA or unknown school). A well-known researcher has a reputation to maintain (so they won't recommend someone bad), and adcom member trust people that they know, or heard about and respect (compared to someone they don't know).

However, most students don't have an opportunity to interact or work with well-known researchers. So what to do? It is perfectly fine to have a letter from people who know you well enough to talk about *your research experience and capabilities*. These include profs., researchers, postdocs who have mentored and worked with you. In fact, a personal, customized, and strong letter from even a senior PhD grad student who mentors and knows you well is much better than a generic letter from a well-known superstar who does not know you well.

Didier *Should letter writers have PhDs?* In Rwanda, a lot of students interact more with teaching faculty who might not have PhD.

Vu: This is an interesting and useful detail that US faculty might not be aware of. Students should mention this in their statements. In general, someone with a PhD has been through the research process and therefore can better evaluate your research ability. But if you do not have such people, then someone who can properly evaluate your research ability is still OK (and again, explain that in your SOP).

3.1.2 LoRs from Dept Chair, Dean, or Boss and Supervisor at Work

Many students try to get LoRs from high-ranking administrators in their universities such as department chair/head, dean, or director. The students never worked with these people (they might take a class or so with these profs), but mistakenly believe that these LoRs are valuable due to the writer's high position in the university. However, as emphasized, a generic LoR has little value because the writer does not know you well and can talk in depth about your research ability.

Moreover, while being well-known and respected in your local university, these writers might not be very active in research (e.g., they haven't published in recent years). Thus they might not be well-known and recognized by adcom members.

Vu: In my experience in reviewing applications, letters from admin people are often generic and do not provide much value. In many case, the letter reads like it was written by a student (§3.1.4), and thus is a red flag. So if you are in this situation, you should find someone else to write for you as mentioned in this section.

Many students get letters from supervisors from companies where they did internships or are working. It is OK as long as it is a research-based personalized

letter. Again, the emphasis here is *research*, i.e., the letters should describe your research experiences and potential. Letters focusing on non-research projects at a company won't carry much weight.

Finally, despite best intentions, the writers might not have the experience to write a strong LoR or lack the ability to evaluate your research ability. This is unfortunate but common, and if you are in this situation, you should find someone else to write for you (see §3.1 and §3.1.1).

Hung: A sad reality is that most professors in Vietnam **DO NOT** know how to write a good letter, or are lazy in writing letters hence delegate the writing to the students. Unfortunately, there is no easy solution to this problem.

3.1.3 Generic Letters are Bad

When the writers do not know much about the applicants (e.g., just taking some course with them or not making any impression to write about), they might write a generic and short letter, which is not useful and also considered weak.

This does not mean the professor is not good or does not care about you, but they just do not know you well enough to write a strong letter. So it might be a good idea to directly ask if the prof. is willing to write a *strong* letter for you. If not, then you should ask someone else. For example, if a student I don't know well asks me to write a letter for them, I will explicitly tell them I don't know them that well to write much about them, and such a short, generic, and weak letter will not help their case.

Vu:

Several international students mentioned that some professors are unwilling to write letters or write weak ones because they do not want (good) students to go abroad or only go to places where they want the students to go to. If you are in this situation, you should find someone else to write for you.

Sometimes students would go to great lengths just to get letters from “top” professors in their school (e.g., department head or dean). But as mentioned, if these professors do not know you, their letters would likely be generic and carry little value (sometimes **red flags**). Moreover, a top professor at your university might not be well-known to US faculty (see more details in §3.1.2 and §6). So save the trouble and get letters from *any* professors/supervisors who know you well and can write a good letter about *your* research ability (§3.1.1). It's better to have a good personalized letter about your own research ability from someone who is less well-known than a generic/weak letter from a well-known person.

3.1.4 Self-written Letters are Bad

Many profs. and letter writers ask students to write their own letters, which is a common practice in some countries. Unfortunately, such letters have *little value* and are considered weak by reviewers—why can you not even find someone who cares or knows enough about you to write a candid personal reference letter? Instead of the ref. writer talking about you, in it is you who write about yourself (and they just sign the letter).

Self-written letters are *easy to spot* because an experienced professor would write very differently compared to an undergraduate student. For example, they can provide convincing and concrete examples based on their experience and compare you to their own students, and of course the writing style is different. Worse yet, if we suspect that the student wrote the letter, it is a **red flag** as we will question both the student's integrity and the letter writer's credibility.

Vu: Well-known and well-respected profs would *not* ask you to write your own letter (in fact, even not well-known ones wouldn't do this to students they care about). This might be a common practice at specific universities and the students do not have a choice as they need the letter. However, think about this: if a prof. does this often, then they either don't know how to write a LOR (more common than you would think) or simply do not know or care enough about you. In any case, such LoRs are not useful and might even hurt your application. So if you are in this situation, you should find someone else to write for you.

3.2 Asking for LORs

As mentioned in §3.1, LoR writers should be someone who knows you well and has the credibility to evaluate your research ability. In the US, it's common for students to explicitly ask if the writer would be willing to provide a strong letter, and the writer are also very direct in their response. If they are not willing (you should be thankful that they are honest with you), then you should ask someone else.

Below are some tips to approach your LoR writers:

- **Ask in advance** You should ask for LoRs *at least a month* before the deadline. People have commitments and writing a strong LoR takes time (§3.2.5), so give them enough time to write a strong letter for you.
- **Waive your right (§3.2.1)** You should always waive your right to see the letter. This shows that you trust your writers and that you are not trying to twist their words.
- **Help your writers (§3.2.2)** You should tell your writers the programs you are applying to, their deadlines, etc. You can also share your SOP with them and other details about your research experience and potential.

- **Ask for feedback** If the writer is very close to you and willing to, you can ask them for feedback on your SOP (§5) and other application materials. If the writer is a professor, they might have served in adcom committees, seen many SOPs, and can provide valuable feedback.
- **Follow up and Stay in touch** Follow up with your writers to make sure they have submitted the letters on time. Note that their letters might have a different due date than your application (§3.2.3).

After your writers have submitted all of their letters, *thank them* (§3.2.4). Let them know the outcome of your applications and stay in touch with them. This will help you build a relationship with them and you might need them to write for you again in the future.

3.2.1 Waiving Your Right

When you ask someone to write a letter for you, you should *always* waive your right.

Choosing not to look at a reference letter is pretty standard in school and job applications. When you waive your right to see the letter, it adds a layer of trust, showing you're confident in your choice of referees and that you're not trying to twist their words. It's also about keeping things open and honest between you and your letter writers and encourages them to be real about your strengths and qualifications. Plus, it keeps things private.

If you do not waive your right, the letter writer might refuse to write for you or write a generic letter that does not help your case. Reviewers also might raise concerns about a letter that is not waived, e.g., if you do not trust your letter writers, then you should find someone else to write for you. In short, it's a standard practice and a way of keeping things straightforward and respectful in the whole recommendation game.

3.2.2 Helping your LOR Writer

As mentioned above in §3.1.4 and §3.1.3, do not write your own letter and generic letters do not give much value. Thus, to help your writer to write a strong, customized LoR, you can provide them details or unique things about yourself. For example, let them know about your GPA, research and work experience, papers (if any), or anything you want them to mention. If the GPA in your program is highly competitive (§6.2) and they know that, remind them to talk about it in the LOR. You can also provide them with a draft of your SOP so that they can see what you are saying about yourself and complement that with their own perspective.

Sometimes your writer will explicitly ask you for such information, but if not, you should provide it anyway (especially if you have not interacted with them much or have not done much research with them).

Vu: If your grading system is not US standard, or you are from a good school unknown outside your country, you can ask your reference writers to explain that in their letters. For example, “Bach Khoa” are the top universities in Vietnam for STEM studies but few people outside Vietnam know about them. So if you are from there, you should ask your reference writers to mention that.

3.2.3 Reminding Your Writers

After entering your writers’ information in the application system, you should tell your writers about that and let them know they will soon receive an email from the university to submit their letters. You should also tell them when you submit your application and remind them to submit their letters on time if they haven’t done so.

Note that most places only have deadlines for the applicant, but are very flexible with the letter writers. In many cases your LOR writers *are not given any deadline*. Fig. 3.1 lists several LOR invitation emails I received from various universities in the past few years.

Also, many places do not begin the admission review process right after the deadline and work on application reviews in the next semester (mid-January).

Thus you do want to send reminders because professors can be quite busy and might forget to submit their letters, especially when there is no explicit deadline. However, do not send too many reminders as that can be annoying to the writers.

3.2.4 Thank Your Writers

After your application is submitted and your writers have submitted their letters (i.e., the wait begins), you should send a quick thank you note, which serves both as an acknowledgement that you know they have submitted the letters and as an appreciate for their help.

You should also let them know the outcome of your application, regardless of whether you are admitted or not. In addition to being a common courtesy, this can also help maintain a good relationship with your writers, which can be useful in the future (e.g., if you need another letter for another round of applications or for a job reference).

3.2.5 How is a LoR written? Is it lots of work?

If a student asks me to write letter for them, I will agree as I believe it is part of my job. However, I will ask them to waive their right to see the letter (§3.2.1), and will not write if they do not do so.

I will also let the student know if I cannot write a strong letter for them (e.g., I don’t know them that well), and suggest they find someone else. If they insist, then I will write for them. While I try to say something positive, e.g., the student is

No deadline given Examples with no deadline given:

Sample 1: .. is applying for admission into the Computer Science (Ph.D.) program in the Graduate School at the University of Massachusetts Amherst and has listed you as a reference.

They have waived their right of access to see your reference.

You may submit your reference online via the Graduate Reference Center, which is located at .. Please use the email address and code shown below to log in to submit this reference. A timely response is important for this applicant to be favorably considered. Please be aware that the applicant's admission could be contingent on your prompt response.

Sample 2: Dear ..

.. has requested that you write a letter of recommendation for their Illinois graduate application. We greatly appreciate your feedback on X's ability to succeed in their graduate studies at Illinois.

In an effort to make this process as easy as possible for you, we offer the ability to upload your recommendation letter online through our secure website. To submit your recommendation, please use the link below. This link is unique to this recommendation and should not be shared or forwarded.

Thank you!

Sample 3: .. is applying to the University of Nebraska-Lincoln and has named you as a recommender. **This applicant has waived the right to view your recommendation.** Please complete our brief recommendation form (or if necessary, decline to recommend).

Should you experience any technical difficulties or require assistance with your account, please contact CollegeNET Support.

Thank you.

Deadline given Several examples with a deadline or some date mentioned:

Sample 1:

Dear Dr ..

.. has listed you as a reference in an application to the EECS graduate program at MIT. If you are not .., please ask .. for the correct letter submission information. Please submit your letter here: ..

The deadline for the applicant is **Dec 15**; we start the admissions process immediately after that date, so we would appreciate receiving your recommendation by then. The applicant can see if you have submitted a letter, and may remind you.

Even though the applicant knows the link for submitting a letter, the applicant is unable to read your submitted letter. The https URL ensures that you connect to MIT's graduate admissions server. That server accepts letter submissions, but will not reveal a submitted letter. The link .. provides a bit more information on MIT's approach to collecting letters of requests.

Thank you!

Sample 2: Dear Recommender,

The applicant listed below has applied to a graduate program in the School of Computer Science at Carnegie Mellon University and has requested a letter of recommendation from you.

Applicant: ..

Click Here if your mail system provides html content or use the URL below to enter your letter of recommendation in PDF form only.

Your letter of recommendation is due by **12 p.m. (Noon) EST on December 10, 20XX**. Thank you for taking the time to respond.

Fig. 3.1: Examples of LOR invitation emails

hardworking and receive good grades, the letter will still be short and weak (§3.1.3). Usually it takes me about 5–10 minutes to write such a “weak” letter.

Strong letters take a lot longer as it will be personalized. While I have a general template for LoR, it still can take me *an hour or more* to write it. I often ask the students to provide information (§3.2.2) and what they think I should highlight in the letter. They can also provide me their SOP (if they already have written one) so I can complement what they say with my own perspective. I often do not share what I write with the students, just to keep it more genuine and honest.

My letter always has the university letterhead, my signature, and is signed and dated. While using a letterhead or signing the letter is not required (I never paid much attention to these when reading LoRs), it makes the letter more official and professional. This website has the template of the letter with letterhead and signature: <https://www.overleaf.com/read/xzyrxdjfxsp#2a1f9e>.

I usually submit a letter for a student in batch (e.g., I submit to all universities that student is applying to at the same time). Typically, each submission takes from 5–10 mins, depending on the application system. I will also let the student know when I have submitted the letter, and ask if I miss any.

Chapter 4

Research Experience

*“I’ve got to study harder and
publish faster!”*

THE SIMPSONS

Here we look at publications and other research experiences that can strengthen your application. §E provides more information on how to find research opportunities, e.g., during your undergrad study.

4.1 Publications

The most concrete evidence of research ability is having *papers in reputable international journals or conferences*. Having published papers, especially at top venues, is a sign that you have been successfully involved in research.

Publications are *never required* for application, however given the competitiveness of CS admission, they can significantly strengthen your application and *are becoming the norm*. Applicants admitted to top schools, especially in popular fields such as ML and NLP, often have multiple first-authored papers at top places. Fig. 4.1 shows examples of applicants to Stanford CS PhD.

What if I don’t have any pubs It is understandable that many students do not have the opportunity to publish papers. Thus, other writings, even those under submissions or even rejected, would still be good and better than nothing. Be sure to upload your these with your application (§8.2) and talk about them in your SOP (§5). Adcom members can quickly skim over the paper to determine its quality (§15.2).

Note that local conferences and non-English journals or conferences do not carry as much weight since their quality is often unknown to US faculty. However, if you have published in such places, you should still upload them, mention them in your statement, and explain why they are good.

Fig. 4.1: Applicants to top CS programs have multiple first-authored papers at top places.

I am not the first author Being the first author is good because it indicates you own the work. However, it's *perfectly OK to be second or third or even last*. Adcom members know it is difficult to publish a good paper, and so being a co-author is still a good sign about your research experience. In any case, especially in the case when you're not the first author, you should explain the work and your contribution. Better yet, have your LoR writers (§3.2.2) talk about your work and contribution in their letters.

Craig: Mason and many other universities allow you to upload your published papers and other writing samples (§8.2). In many cases, even if the papers were not published at top places, we can still determine their quality by simply skimming over the paper.

Vu: Many international students mention Scopus Q1, which consists of various journals from IEEE, Elsevier, and many other publishers. I don't know/recognize many of the journals listed in Scopus Q1. This might be something to be mindful of, as CS faculty might not be too familiar with Scopus or journals listed there, so devote some part in your statement to discuss the significance of your papers.

Thanh: Due to academic culture, professors in Vietnam usually aim for (international) journals instead of conferences. Could you give some tips on how to know whether a journal is good (CSrankings, unfortunately, only consider conferences)?

Vu: One way is looking at what well-known researchers publish. For example, if you are interested in a field X, you can use CSRankings to look at active faculty in X, and then look at their websites to see what journals they publish at.

4.2 Work Experience

Work experience at *well-known research laboratories*, such as Microsoft Research, can strengthen your application. The emphasis here is *research* places, not software development or non-research work. For example, working at a FAANG (Facebook, Amazon, Apple, Netflix, Google) company as a software engineer does not count as research experience, although it can be helpful for MS applications (§D). Similarly, a LoR from your supervisor for non-research experience might not count much (§3.1.2). So do not spend much time talking about development job in your SOP.

Note that adcom reviewers might not be familiar with all research labs, especially those outside the US. For example, while VinAI is well-known in Vietnam and potentially in Asia, it might not be very well-known in the US. So you or your LoR writers should explicitly say something about them in your statement or letter. In general, if you did some good research work, then you should mention that in your SOP and ask your supervisor to write about it in their LOR (§3).

4.3 Competitions

Winning *internationally recognized competitions* can demonstrate your research potential. For example, participating in Math Olympiads if you want to do theory or winning ACM programming contests if you want to “build” systems, e.g., software analysis. So do talk about them in your SOP (§5) and have your LoR writers mention them in their letters (§3.2.2).

Chapter 5

Statement of Purpose (SOP)

*“All my life I’ve had one dream:
to achieve my many goals.”*

THE SIMPSONS

While you might not have control over LORs (§3) or where you go to school (§6), you do over your statement of purpose (SOP) or personal statement¹! A well-written SOP also shows that you can communicate, which is very important in research, and that you can effectively teach and communicate with students, which is important for TA funding (see §12). Many SOP samples for CS are [available here](#).

In your SOP, focus on research potential (§4) and convince us through your experience, e.g., published papers (§4.1). Back up your claims with **concrete evidence**. For example, if you say you have experience with teaching, then show what you did, e.g., undergrad TA or mentoring someone. If you say you work on a research project, then show some results, e.g., paper submitted (or even rejected), achieved certain performance improvement over the state of the art.

¹Few schools separate these documents and ask you to write both: SOP, which focuses on research experiences, and personal statement, which is everything more personal, e.g., why PhD, challenges, diversity, etc

You should talk about things that adcom members might not know about and can help make you **stand out** in the application pool of thousands of applicants, e.g., your personal Github project with hundreds of stars or your regular contributions to well-known open-source projects (see §11.3 for increasing your admission chance).

This is a simple task often overlooked by many applicants: **tailor your SOP** to the institution you're applying for, e.g., why do you apply *here*? who do you want to work with? Provide names of professors who you're interested in (if they are not already in the adcom, your application might get forwarded to them for evaluation; and they might be interested in interviewing and recruiting you). This shows that you're serious and have done homework on places you're applying to. Adcom will look for this part (§11.2).

Finally, have your SOP reviewed by your LoR writers (§3.2.2) and professors, especially those who have served in adcom, or even postdocs or PhD students as they have been through this process.

Vu: I often read LORs and SOP first (§15.2). If I am persuaded by then, I would skim over other factors and advocate for admission (unless I see red flags in other parts). However, if I am not convinced, then I will likely recommend rejection (unless I see something stand out in other parts).

Do careful research on professors, don't mention *emeritus* or adjunct faculty (§14.2). Also, be careful not to send statements to the wrong schools or provide wrong information (e.g., talking about school X but mentioning working with profs. at school Y; and do not talk about George Washington when applying to George Mason). I have seen such statements more times than I should.

5.1 Kiss of Death in SOP

- **Too personal** Don't talk about your personal issues, e.g., family, health, relationship, etc. This can raise concerns about your ability to handle the PhD. Don't talk about religious or political beliefs (§G).
- **Criticizing** your current or previous institution or professors. Just like in a job interview, don't badmouth your current or previous employer.
- **No concrete evidence to back up claims:** e.g., saying you are passionate about a research topic without showing any experience. This is where specific names (work submitted at conf. X), numbers (outperformed SOTA by Y %), and examples (worked on project Z) can help.
- **Use flowery and AI-like language.** Don't use AI to write your SOP. Not that hard to raise suspicion. Though you can ask AI to check your grammar and spelling.

- **Not customized to the program:** If your SOP can be sent to multiple programs with few changes, it is too generic. Do some research and mention why you want to spend the next 5–7 years there.
- **Mentioning wrong professors:** do not mention emeritus professors or those who have left. Teaching and adjunct faculty are often not active in mentoring PhD students (§14.2). Do your homework and mention profs who are still active in research.
- **Too Long and fancy format:** As mentioned, keep it under 2 pages. Don't use too much coloring or fancy fonts (like those in Words). Don't use left alignment (seems to be default in Words) as it is hard to read. CS academics like using **LaTeX** (common way to write our papers and other documents), so write your SOP using LaTeX (with Times or default font, 11pt, and 1-inch margin).

- [CS PhD SOP database](#) by cs-sop.org

5.2 Diversity Statement

Some universities require a diversity, equity, and inclusion (DEI) statement as part of the application. Students, especially international ones, often struggle with what to write, especially when they are not from a minority group or do not have much experience in DEI.

A DEI statement is about showing your *awareness* of DEI, *understanding* of the challenges others face, and *potential things* you can do to contribute.

- **You don't have to be from a minority group.** You just need to understand what DEI is, e.g., be aware of challenges faced by minority groups in studying CS, STEM fields, academia, workplace. Show that you understand the importance of DEI and how it can benefit the CS field and society.
- **Show your awareness, customized to your own experiences.** If you come from a different culture or country, talk about DEI there. Many countries, especially developing countries, do not have/care about DEI or even have laws against it, so does minority group face in your country? How do you think DEI can benefit? Remember, you would have a unique perspective on this topic that we might not know about, so use that to your advantage.

- **Highlight your contributions.** You do not need to be in any group or organization specific to DEI. You can talk about your contributions to your community, e.g., mentoring students, organizing events, or even just helping people in needs. If you don't believe you have done anything much, then talk about what you plan to do.
- **Customized it to your application** Can your PhD study or research contribute to DEI? Can you help or mentor students from underrepresented groups from your country? These are very doable and can be very convincing.

Vu: One common pitfall is to write about how you are from a poor family, a small town, or a developing country. These are not related to DEI and show that you do not understand the topic. I have seen people consider themselves as minority because they are Asian or international students studying in the US (have you seen how many Asian or international students are in CS programs?).

Moreover, do not make up stories or exaggerate your experiences. Just show your awareness and understanding of the topic and what you did or how you plan to contribute to it (e.g., mentoring students, helping others). One of the best statements I have read starts the acknowledgement that the applicant is not a minority, but a white male in a STEM field (i.e., they are the majority), and that they do not have much experience in DEI, but show that they are aware of the challenges faced by minority groups and how they can contribute to it.

Chapter 6

Your School and Grades

*“Woohoo! I’m a college man! I
won’t need my high school
diploma anymore”*

THE SIMPSONS

6.1 School

Graduating from top universities *that adcom members recognize helps*. For example, if you are an international student and your school is well-known, then it is “*top foreign*”, which is a plus. However, if we do not know much about schools in your country, then we are uncertain about the quality of your school and likely treat your school as “*unknown foreign*”, which can be a minus point.

The reason is similar to LoRs (§15.2). If we know your school has a good reputation, then we can trust the education and grades from your school. If we do not know your school, then we are uncertain about its quality and the grades you received.

Many international students mistakenly believe that their school is well-known, but in fact, it is not, e.g., many Vietnamese students believe that “Bach Khoa”, which is one of the best universities in the country, is well-known, but it is not (and their confusing acronyms HUST and HCMUT only make it worse). So if you think your school is well-known, mention it (and back up with some evidence like rankings or awards) in your SOP. You can ask your LOR writers to talk about your school as well (§3.2.2). Of course, if you’re interested in working with Vietnamese, consider [CS programs in the US that have Vietnamese professors](#).

Vu: Sometimes PhD adcom in the US will share a document such as [this one](#), which lists the top schools in several countries. We also ask other faculty and students if we think they know about the place. For example, when I was a postdoc at UMD, members of their CS PhD adcom asked me to evaluate applicants from Vietnam. During my time at UNL and now here at Mason, I have looked at Vietnamese applications (whether they are assigned to me or not) and provided input to their reviewers, e.g., X is the top tech school in Vietnam and so it should be *top* instead of *unknown* foreign, which makes a huge difference.

Deepak: If an applicant is anxious about their school not being known outside their country, they can provide information about their school and department, with independent sources where such information can be verified.

6.2 Grades

Compared to other factors such as LoRs (§3) and research experiences (§4), grades generally do not matter much for CS PhD admission. PhD in CS is a research degree and doing well in undergrad courses does not necessarily mean you can do research (other factors such as research experiences, pubs, LoRs are more important). In fact, many CS faculty members themselves have bad grades in undergrad courses (and some were proud of that!).

Nonetheless, if you are from a well-known school (§6), having good grades do help (not a lot though), e.g., adcom members often note details such as "good GPA from well-known school (§15.2)". However if your school is not well-known, having top grades or rankings usually will not help because we cannot evaluate them (e.g., we don't know how hard it is to get a 4.0 or A's at your school). This can be an issue for students in many top international universities where the competition is so high that very good students can still have low rankings from these schools (and be overlooked by adcom).

As with school reputation, you and your LoR writers can mention the grading system of your university if you think that is helpful for adcom to evaluate (§3.2.2).

Thanh: Vietnamese universities typically offer specialized programs, such as the talented engineer program at HUST, that have highly competitive entrance exams and a limited number of available slots (e.g., 30 per year). However, these programs often set higher requirements for students, including more demanding tests and assignments, resulting in lower GPAs and overall rankings. For example, 3.5 GPA students from such talented programs are typically much better than 4.0 GPA students not in those programs. Similarly, variations in GPA standards exist among different universities, with technical universities generally having lower GPAs than economic universities. These make gaining admission in the US difficult as US faculty are not familiar with these issues.

Vu: Vietnamese students and even faculty often lament how this grading system hurts Vietnamese students applying abroad. One way to mitigate this is to make these issues known in your SOP. [Universities with Vietnamese profs](#) are probably aware of them, but in general your letter writers *and* you can explicitly mention these in their letters and your statement.

Bad Grades While having good GPA might not help much (again, because of other much more important factors), having bad GPA can hurt your application. Many universities have a minimum GPA requirement (e.g., > 3.0) and will automatically reject applications with lower GPAs. If you have bad grades, you should explain them in your SOP or better yet, have your LOR writers explain them in their letters if they know the reasons.

Moreover, having bad grades in relevant courses, e.g., Math and CS, can be a **red flag**. Adcom members often scan through transcripts (§15.2) looking for C and lower grades in Math and CS courses and might raise concerns if they see several of them. Note that bad grades in non-relevant courses, e.g., e.g., about politics or history, are not as concerning.

Should you explain bad grades in relevant courses in your SOP? If you have just a few, they do not matter much, so don't spend much time explaining them (many adcom reviewers themselves have bad grades in relevant courses!). But if you have many bad grades for an entire semester or year due to some specific reasons, then you should explain them in your SOP.

Chapter 7

Standard Tests (GRE and IELTS)

*“I’ve got to study harder.
Everyone knows standardized
tests are biased against the poor,
the lazy, and the stupid.”*

THE SIMPSONS

7.1 GREs Are Optional and Do Not Matter for PhD Admissions

While a few schools still require taking the GRE (e.g., UCF), most good CS PhD programs in the US **no longer** require it. The reason is that GRE scores do not correlate well with research ability, which is the most important factor for PhD admission. It is also worth noting that many faculty members themselves did not take the GRE or have bad scores.

Thus, if you have bad GRE scores or haven’t taken the GRE, then don’t waste time (re)taking it. Being optional really means optional, and not taking it will not hurt your application. However, if you took it and have really good scores then it might be worth it to include (and perhaps talk about) them in your application, but don’t expect them to make much difference. But if your scores are bad, then you should not include them in your application, which can be a **red flag**.

Note that while GRE is not important for CS PhD admission, it might be required or important for MS admission (§D). This is because MS programs are more course-based and thus care more about grades and standardized tests.

7.2 English Tests (IELTS, TOEFL)

Unless your degrees are from the US or certain countries such as [these](#), you will need to take standardized English tests. On one hand you will need to show some level of

English proficiency, but on the other hand, you do not need to have very good scores in these tests (many adcom members themselves were once international students and struggled with English). You should just do well enough to pass the minimum requirement set by the university. Just as with grades (§6) and GRE (§7.1), having high scores in these tests might not help, but having too low scores can be a **red flag** and sometimes results in an automatic rejection (§11.2), e.g., below the minimum requirement.

Vu: Here is the minimum requirements at Mason. Being above this might not mean much, but below is a **red flag**.

- GPA: ≥ 3.0 in your undergrad (but we also consider the rank/prestige of your school)
- GRE: not required
- **English proficiency requirements** (one of the below)
 - TOEFL: 80 OR
 - IELTS: ≥ 6.5 OR
 - DuoLingo Graduate English: ≥ 120 OR
 - Pearson Test of Academic English: ≥ 67

Chapter 8

Miscellaneous

“I’m not a college graduate. I’m not even a high school graduate. But I’m a pretty good judge of character.”

THE SIMPSONS

8.1 CV

The CV provides a summary of the applicant’s achievements. Most schools require you to upload your CV with your application.

Prepare your CV in such a way that allows reviewers to quickly scan to identify major achievements, e.g., Publications, Programming Competition Awards, and Teaching Experience. Moreover, you don’t need to adhere to the 1-page rule of resume in job searching, CV has no such requirement and is often longer.

Vu: Unlike a job application, CV is not as important for PhD admission because we do not screen applicants based on their CV. Moreover, we care and pay attention more about your LOR, SOP, etc. So do not spend too much time on your CV, just make sure it is easy to skim through (§15.2) and well-organized around research activities and achievements.

8.2 Writing Sample

It is a good idea to upload a writing sample, e.g., a paper you wrote, a report, or a thesis. Whether the paper is published, not published, or already on Arxiv, you should upload it. Because samples are part of the application package, adcom members can quickly skim through it to see your research and writing abilities.

8.3 Online Courses and Certificates

These do not carry much weight as they do not show research ability. We do not care much if you have taken an online Coursera AI course or have a professional certificate from Microsoft. However, as mentioned in [§1.3](#), if you do not have a CS background, you might be able to use these to show you have sufficient CS knowledge.

Part III

After You Apply

Chapter 9

Interview and the Waiting Game

Bart: “Are we there yet? Are we there yet? Are we there yet?”

Homer: “No!”

Bart: “Okay, how about now?”

THE SIMPSONS

After you submit your applications, the waiting game begins! For many students, this is a very stressful time. This section provides some information and tips to help you get through this time.

9.1 Interviews

After you apply, you *might* get interviews. The most common case is that a prof. is interested in working with you and wants to chat, e.g., to offer RA (§12.1.2). In some cases, the interview is done by several professors, e.g., to see if a student fits in their group or to recruit a very strong student to their program.

When do interviews happen? The timeline for interviews varies. Faculty set up interviews based on their busy and erratic schedule. Some try to get interviews done before the holidays, while others do them after the holidays. Do not be surprised if you get an interview invitation at the last minute. Some profs. are informal and may just email you to chat (e.g., “*could you chat in an hr?*”), while others might schedule a formal interview (e.g., “*can you chat at 2 pm on Friday or 10 am on Monday?*”).

Some programs **do not do interviews** at all (§9.2). They review applications and make decisions based on them. If you do not get an interview, it does not mean you’re out.

Vu: At Mason, faculty are encouraged to interview candidates. For very strong candidates, the interview is actually to recruit them. In some cases a faculty interviews a candidate that they see potential and want to advocate for their admission. Without the interview, such applications may be more likely to be rejected.

In short, getting an interview is a good sign; it means that someone is considering you. If we are not interested in your application, we will not proceed with an interview.

Preparing for interviews Typically, an interview takes about 15–30 minutes, and one important aspect of evaluation is your ability to effectively communicate, including speaking and understanding English. You might be asked to talk about your research experience and interests and to read a paper and discuss it. In some rare cases you might also be asked to solve a problem (one of my colleagues at Mason often does coding interview).

You should treat the interview as an informal chat. Prepare an “*elevator pitche*” about your research experience and interests. You might also want to have a 5-minute presentation about your research. If a prof. asks you to read a paper, do it and be prepared to discuss it. You should also ask if you need to prepare for coding. Finally, the interview gives you an opportunity to ask questions, e.g., about the program and the professor’s research. You should definitely ask as it shows that you’re interested. See [some questions](#) you can ask.

Follow-Up Emails If you had an interview and have not heard back, you can email to ask about the status of your application. See [§10.1](#) for how to check status and follow-up emails.

Updating your profile You should not send emails to update your profile. However, if you have new publications or other big achievements, you can ask them to update your application (though no guarantee that they will consider them).

9.2 Not Getting Interviews

While it is generally good to get an interview, not getting one *does not* mean you’re out. Many programs do not have the tradition of interviewing applicants. For example, at Mason, most admitted students with TA ([§12.1.1](#)) do not go through interviews.

However, no interviews mean that you will not likely get an RA ([§12.1.2](#)), which is offered by an individual faculty (if they want you to do research for them, then they likely will interview you first). If you have no interviews, your application (and TA/fellowship funding) is decided by the adcom.

9.3 Notification Timeline: Why rejection letters are sent so late?

Some schools send out admission letters in batches, some do rolling admission, and some do not send anything out e.g., you're on their waitlist. You should hear back from most schools by mid-March, though rejection can come out much later.

Not much you can do other than to be patient and wait. Do not send emails asking about interviews or status (unless you have interviewed specifically with someone then you can ask that person for status updates and other questions ([§10.1](#))).

Acceptance Letters Universities prioritize sending out acceptance letters first. This allows the admitted students to make decisions and plan for their studies.

Some universities have rolling admissions, meaning they send out acceptance letters as they review applications (e.g., some universities sent out letters as soon as early February). Others have a specific date when they send out the first round of acceptance letters.

Response Deadlines Accepted students are usually given a deadline to make decisions on their offers, often around **April 15th** in the US. This is a standard deadline for PhD programs due to the Council of Graduate Schools Resolution ([CGS](#)). After this date, CS programs can gauge how many slots remain unfilled.

Waitlist Most CS programs have a limited number of slots for PhD students, and thus put many good students on a waitlist. If accepted students decline the offer, then offers are sent to students on the waitlist. So if you see people getting accepted, that does not mean you are out yet.

Rejection Letters Schools typically start sending out rejection letters to remaining applicants *after they have finalized their admissions decisions*. Thus, rejection letters are often sent out late (e.g., after April 15th or even much later). Not much you can do here. You can try to contact the school to ask about your status, but they might not reply, they might say they are still reviewing applications, or give you inaccurate information (e.g., you will hear in two weeks). In short, you just have to be patient and wait, and also beware that some schools do not send out rejection letters at all.

Chapter 10

Getting Admitted

“Oh... and how is education supposed to make me feel smarter? Besides, every time I learn something new, it pushes some old stuff out of my brain. Remember when I took that home wine-making course and I forgot how to drive?”

THE SIMPSONS

By around March you should hear back from most PhD programs that want to admit you. But you likely won't hear back from schools that do not want to admit you (§9.3).

If you receive offers, congratulations! Now you're at a different game because the schools that have admitted you will try to get you to accept them! Important factors to consider include the reputation of schools and professors (§13), and funding availability (§12). You will likely have to make your decision (§10.1) by around *April 15*, which is the deadline for most schools ([why this date?](#)).

Open House Most schools have *Open House* or *Visit Day* events, which are a great resource to learn about the school, department, faculty, research, living, etc.

Even if you can't come in person, you should attend virtually and meet with individual faculty. During the event, you get a chance to learn more about the program, and talk to individual faculty and current students. Take notes of faculty who make you excited, and count those taking in new students (if they meet you, likely they are considering new students!). Talk to students about their advisers, the dept, the area, and the funding situation. Ask about anything you want to determine that they deserve *you*.

Vu: Mason has *Virtual* Open House (VOH), e.g., <https://cs-Mason.github.io/cs-phd-voh-s23/>. We invite all admitted PhD students to the VOH through Zoom to learn about the CS program, the department, Mason, and the DC area in general. Students also get opportunities to chat with professors and current students.

What's next? Make a decision, accept, reject, or defer the offers (§10.1). Ask to meet with potential advisers (e.g., through Open House or separately) and even their students. Ask about computer equipment and software, office space, and other resources; in many cases these will be provided for free by your adviser or department (§10.3).

Also, do not forget to update and thank your LoR writers and others who have supported you through this process.

10.1 Checking Status, Accepting, Postponing, and Decline Offers

Students often ask about what to do after they get an interview or an offer from a professor, e.g., if they can followup to find out about their status, or is it OK to postpone or accept/reject offers?, and most importantly, how to do so without offending anyone.

Checking your application status and Follow-up emails If you have interviewed and not heard back from a professor after a few weeks or especially around the time when universities send out their admission decisions (around late Feb–mid-Mar), you can email to check. You can follow up the interview invitation and say: *“Thanks for chatting with me. I am very excited about the opportunity to work with you. Could you please let me know if you have made a decision or if you need more information from me?”*. If you have new updates, e.g., new publications or new fellowship awards, or even new offers from other professors or schools, you can also mention that.

Profs. are often very busy, especially during admission time when they have to many reviews and interviews. They might not have time to respond to every email. If you do not hear back after a week, you can send another email to check again. If you still do not hear back, you can assume that you are not selected.

Accepting an offer If you decide to accept an offer, you can say: *“Thank you for the offer. I would like to accept it and look forward to working with you. Could you please send me more details about the offer and what to do next?”*. The prof. will likely send you more details about the offer and what to do next. If you decide to accept an offer, do so quickly.

Postponing an offer If you need more time to decide, you can ask for more time: *“Thank you for the offer. I am very excited about it. However, I am still waiting for other offers and need more time to decide. Would it be possible to postpone the decision for a few weeks?”*. This is perfectly fine and professors will understand and might even appreciate your honesty. They will likely give you a few weeks to decide. If you need more time, you can ask for more time. But do not ask for too much time, e.g., more than a month. You also should not postpone the offer multiple times, which will annoy people.

Declining an offer If you decide to decline or reject an offer, you can say: *“Thank you for the offer. However, I have decided to accept another offer. I appreciate your time and consideration. I hope we can work together in the future.”* Professors will understand and wish you luck. If you decide to reject an offer, do so quickly.

Accepting an offer and later rejecting it I’ve seen many students, especially international, face a dilemma when they *commit* to a graduate offer but then receive a better one. Advice given in online forums is often along the line that it’s okay to switch, using reasons like you haven’t yet had a strong relationship with the prof. or you should prioritize your personal benefit.

In my opinion, these reasons are not strong enough to justify retracting an acceptance. A more valid reason is using the [April 15 resolution](#), in which many universities participate. Among various things, this resolution states that students are free to accept a new offer from a different institution until 4/15, even if they have already accepted an offer elsewhere.

However, in general, retracting an acceptance can have ethical implications. When you accept an offer, you are committing to work with that prof, who then might stop looking for other students. So by retracting your offer, you are breaking your commitment and also causing a great deal of inconvenience to the prof and also taking away the opportunity from other students. Ultimately, this choice is personal and involves a balance between personal benefit and ethical considerations.

10.2 Negotiating PhD offer (e.g., having multiple offers)?

Negotiating a TA stipend is unlikely, as it is determined by the university ([§12.1.1](#)). For RA ([§12.1.2](#)), advisers have more leeway as it is funded by their grants. However, they will likely do not negotiate RA stipend as they have to be fair to other students and also have to follow departmental standards. Typically, the most wiggle room is funding in the summer ([§12.3.2](#)) where the prof. might be able to pay you more from their grants. Note that the university typically automatically increases these stipends each year by a small amount.

For a specific start date or TA assignment (e.g., TA’ing a particular course), you can ask for it. Also, there is typically no moving allowance for PhD students. In

short, standard things set by the university or department are unlikely negotiable. However, you can ask for things such as books and computer equipment (§10.3).

10.3 Buying Computer Equipment

Students understandably get excited about their upcoming PhD journey and want to buy new computer equipment and electronics to prepare. However, you should first check with your professor. They might have funding to buy you computers and other equipment (e.g., software, books, keyboards, headphones, tablets, etc). Many CS programs also provide budget or computer equipment to incoming PhD students (e.g., a laptop).

However, note this is a privilege and a courtesy and not a right. Your prof. is not obligated to buy you things, and that you should not expect these are automatically provided. Also, while the prof. might be able to do so in the past, they might not be able to do so now due to budget constraints. It might also be a need-based decision, e.g., if you need a powerful computer for your research, then the prof. might buy it for you (the lab might already have powerful servers and you can just use them for your work). Finally, the prof. might have a policy on what they can buy for you, e.g., they prefer to get you a desktop instead of a laptop so that you come and work in the lab.

Keep in mind that these computers and equipment would be university property, which might be monitored and have certain restrictions, e.g., do not install illegal software on them (§G.2). You will likely need to return them when you graduate.

Chapter 11

Dealing with Rejection

*“You tried your best and you
failed miserably. The lesson is:
never try.”*

THE SIMPSONS

Rejection is a common part of the PhD application process. In fact, rejection is part of academia (e.g., you will get rejected for papers, grants, jobs, etc). Don’t take rejection personally and to learn from it.

11.1 Try Again!

If you do not get admitted to any schools or don’t want to go to the ones that admit you, try again next year! Grad. admission can involve randomness and noise. In the meantime, you can work on improving your profile, e.g., get more research experiences, publish more papers, improve your connections for stronger LoRs, etc. See rejection reasons (§11.2) and additional advice to improve your chance (§11.3).

You can consider applying to MS programs, which are typically easier to get in; but you likely need to pay (§D.2). A university that rejected you for PhD might accept you for MS. If you get into an MS program at a school of your choice, you can contact professors to work with them. If you do well, you can ask the professor to support you to convert to PhD. You will likely need to apply again, but you will have a much better chance because you have the direct support of a professor there.

Should I ask for feedback? No, don’t bother. You will likely not get any useful feedback. We are not willing (sometimes not allowed) to reveal your evaluation results or give you feedback on how to improve your profile. *So just move on.* If you really want advice, ask your professors, collaborators, ref writers, or those who have previously applied.

11.2 Why did you get rejected?

Many students lament that they get no interviews or are rejected and that the admission process seems random. However, while it is true that the process is not perfect, it is not random. It might be that your profile is not as strong as you *think* it is. Even if it is strong, you still can get rejected, e.g., not a good fit, overqualified, having redflags, etc.

11.2.1 Your profile is not as strong as you think

I have seen multiple cases where students think they have a strong profile, but they do not. Here are some common examples.

Your *LoRs* (§3.1) might not be as strong as you think. Your ref writers might not be very well-known, or active in research, or know how to write a good letter.

Your *school* (§6) might not be as good as you think. It might be T1 in your country (or in your own definition), but US faculty does not know about it, e.g., most US faculty would not know about schools in Vietnam.

Your *research* (§4) might not be as strong as you think. Doing research does not mean much (or anything) if there is no results, e.g., publications (§4.1). Publications might not have much value if they were published locally or through unknown places. Even papers at top venues might not be as good as you think, e.g., many AI/ML/NLP faculty are not too interested in “dataset” papers at NeurIPS.

11.2.2 Other Common Reasons for Rejection

Even with strong profile (e.g., research potential, GPA, LoRs, SOP, interviews), you can still get rejected for various other reasons as follows.

You aim too high You have applied to schools that are *way too high* for your profile (§13.1.2). Many students simply just go for very top schools (e.g., top 10) and are surprised when they are rejected to all of them, in multiple years, and completely get shut out. This is very obvious but many students still do this (§15.1). An analogy is a person who has never hike but wants to climb Mt. Everest (which btw if you could, you might have a better admission chance as mentioned in §11.3).

While being ambitious and aiming high is good, you should understand how PhD admission works (e.g., by reading *this* handbook and realizing things such as having a good GPA (§6.2) or GRE (§7.1) doesn’t mean much to top programs), that in the US there are many good schools, and just be realistic.

Not a Good Fit and Bad luck You could have an excellent profile (e.g., strong research and LoRs), but if you are interested in a research area that the program does not have, you will not be admitted. Similarly, if no faculty is willing to advise you (e.g., they are on sabbatical or personal leave, do not have sufficient funding, or

already have too many students), you will not be admitted. This is actually good for you, as you don't want to be in a program where no one can advise you.

Related to this is that you just have bad luck and apply at the wrong time. For example, since 2024 there has been a huge surge in students interested in AI and NLP (thanks, ChatGPT!). Consequently, AI/NLP faculty might be overwhelmed and cannot consider many candidates, even those with excellent profiles.

Before applying, you should talk to your professors and ask them to give you an honest opinion on where you should apply. To increase their chances, many students apply to a range of schools, including "safety" ones.

Overqualified or Lack Interest This might be paradoxical and is the opposite of aiming too high. However if adcom believes that you are likely to get admitted and go to a better program, they might not be so enthusiastic to admit you and want to save the spot for someone else.

A related reason is that you did not show enough interest in the program. For example, you did not respond to professors interested in interviewing you (which might be considered unprofessional and burn bridges), or during the interview you showed little knowledge, interest, or enthusiasm in the profs or program (because it is your safety).

Low English exam scores (e.g., IELTS or TOEFL) Profs. might not care much about these, but the college or the university often sets a minimum that you need to pass to be considered, especially for TA funding (a low English score causes concern that you might not be able to communicate well with students as a TA). Thus, while profs. are willing to argue for your case, they might be reluctant to go against the requirement of the university.

Red flags Various types of red flags can cause concern to the adcom. Common examples include many STEM courses with low or withdrawn grades, plagiarism, cheating, or other academic dishonesty. Another one is that you have a history of jumping from one program to another. Adcom members might have contacts in other programs and heard about your stories, or your LoRs might mention them.

If you think you have these issues, you should address them in your SOP or ask your letter writers to do so. In general, these things are rare, but they do happen and cause concern to the adcom.

11.3 Increasing your admission chance

Given the high number of quality applicants and a limited number of spots, in addition to having a good application profile, you want to show something that makes you **stand out**. For example, even if you do not have research experience, you can talk about your personal projects, as long as they show you can do research. For example, if you have an open-source project that has lots of stars in Github, mention it. If you often write technical, research-like blogs with many viewers, talk about them too.

Vu: In his [post](#), Matt Might was initially unsure about an application. However, upon learning that the applicant had led a 100km hike in the Himalayas, he decided to accept the applicant. This is a good example of being *stand out*, and I would also advocate for that student as this shows they have the persistence and determination required for research.

There are other things you might not think are important but can make you stand out. For example, if you have a strong background in a non-CS field but can be integrated with CS, e.g., you have a degree or background in *dance* or *music* and want to integrate them with CS, do talk about it. Are you a female or a minority in CS? Do you participate in outreach activities that help increase diversity and inclusion in CS? Diversity is valued in CS programs in the US, and experiences in these areas can make you stand out and get noticed from reviewers.

Part IV

Funding, Schools, and Profs.

Chapter 12

Funding

“Bart, with \$10,000, we’d be millionaires! We could buy all kinds of useful things like ... love!”

THE SIMPSONS

If you’re admitted to a *good* CS PhD program, you should not have to worry about funding! In the US, the common types of funding for PhDs are *graduate teaching assistant* (GTA or TA), *graduate research assistant* (GRA or RA), and *Fellowship*. RA is paid by a prof. for you to do their research. TA is paid by the dept. for you to help with teaching. Finally, fellowship is independent funding that can come from a school, a company, or an organization.

[Tab. 12.1](#) summarizes the differences. Note that funding is typically more available for PhD students than MS ([§D.2.3](#)).

12.1 Graduate Assistantship (TA/RA)

The most common type of funding is **graduate assistantship**, which is either TA or RA. Both TA and RA come with tuition waiving (you don’t have to pay tuition),

Tab. 12.1: Different types of PhD funding. All cover tuition, insurance, and stipend.

	TA	RA	Fellowship
From	School	Profs.	School/External
For	Teaching Assist.	Research	Research
Cover All?	Yes	Yes	Yes
Summer?	No	Maybe	Likely
Pros	Research Freedom	Get to do research	Research Freedom
Cons	Teaching Duties	Research Restriction	Competitive, Limited

health insurance (this takes care of your insurance, which is a must-have in the US), and most importantly, your stipend (i.e., your salary). Some universities also give significant discounts or pay insurance for spouses/children.

Several things about stipends. First, the amount of stipend *varies* and depends on factors such as location (e.g., a stipend in the DC area is likely higher than in Lincoln, Nebraska due to higher living costs). Second, an academic year (AY) year is typically *9-month* in the US, so the stipend is for 9 months. Third, you might get paid over the summer (§12.3.2) through funding from your professor or fellowship (typically no TA over the summer). Fourth, like most sources of income in the US, you will have to *pay tax* on your stipend. Finally, private universities might pay more for stipends, but they could have extra activity fees or some other hidden ones (e.g., you may need to pay some fees for each credit hour).

Vu: TA and RA at Mason have similar benefits in tuition waiving and insurance. The college and department will set the rate for a 9-month graduate assistant stipend. TA, which is paid by the department, will likely be that amount but RA might be higher depending on the prof and the stage of the student (1st year vs ABD^a).

At Mason, CS TA/RA is paid the highest. First, CS is under the College of Engineering and Computing (CEC), which already has a higher TA stipend than other colleges. Second, CS is the largest department in the college, and has the higher TA stipend than what CEC suggests. Finally, it is a tradition that CS faculty pay their RAs more than the department's TA rate. So a winning combination for CS PhD students.

^aAll but dissertation: close to graduate.

Having health insurance is required at many US universities. Do not assume that you're young and healthy and ignore insurance (§G.5). At Mason, and most CS PhD programs, your GTA or GRA comes with full insurance. In fact, at Mason your spouse/children will get a significant discount rate for health insurance. So you will never have to worry much about health issues for you or your family here.

12.1.1 Teaching Assistant (TA)

TA is common in the beginning when you haven't found an adviser who would pay you RA. It is also common to sandwich between TA and RA (e.g., when your prof. does not have sufficient funding or you want to try the TA experience).

Your TA is paid through the school or department, i.e., they hire you to help teach. As a TA, you spend up to 20 hrs/week and help with classes (e.g., grading or teaching labs/recitation). During a semester, a TA might work with several courses and professors (not necessarily their adviser). TA funding is *not* typically available during the summer (§12.3.2), which has few courses.

How to get TA? Unless you have other funding such as RA or fellowships, TA is typically the default for CS PhD programs. In your application, just simply indicate that you need financial assistance. Typically, adcom will either admit you and give you TA, or reject you. We do not admit a student without supporting them (§15.2).

Vu: At Mason CS, admitted PhD students have 4 years of GTA guaranteed, and also receive a stipend for the first summer (§12.3.2).

Even if you have other funding and do not need a TA, you still should do TA at least once. This allows you to see what teaching is like, which is especially helpful for a research career where you often give talks and tell people about your work. Mason sometimes has classes that a more senior student can teach. In that case, you will be paid as GTA or even sometimes as a lecturer. This is a good opportunity for students to get teaching experience and you might even get paid a bit more.

12.1.2 Research Assistant (RA)

RA is provided through a professor through their funding so you can work on their project. You do not need to teach as an RA, so you can focus on your research. Depending on the professor, RA may be available during the summer. §12.3.3 gives more details on RA budget.

How to get RA? When a professor recruits you, they might offer you an RA right away (so you start with an RA). However, a more common scenario is that you first get admitted with TA, and then after a year or two find an adviser to support you with RA.

It is important to note that RA is *never guaranteed* as it depends on the funding situation of the prof. So you should also pay attention to TA, which is a good backup plan (remember, typically TA and RA have quite similar benefits). This means you should also check if TA is readily available for PhD students in the program.

Vu: If you got recruited and offered an RA by a prof., you will likely get admitted. For example, if a prof., even if not in PhD adcom, wants to fund you, adcom will likely respect that decision and admit you.

12.2 Fellowships/Scholarships

Fellowship is another type of funding that students can get from the university, industries, or government. Fellowships are typically competitive and generous, giving pretty much all benefits tuition/insurance that a TA/RA has. They might even give higher stipends (including summer) and open doors for job opportunities such as internships.

How to get Fellowship? Many schools provide fellowships to attract students. You likely will not need to do anything and adcom will recommend such fellowships

to strong students. Some schools automatically offer a fellowship to all accepted students, while others only award it to a limited number of admitted students, such as the top percentile.

For external fellowships including those from the US government, e.g., see §F for NSF GRFP and DOD NDSEG, and tech companies (e.g., Google, Microsoft, Facebook), you will need to apply. Prestigious external fellowships typically require a clear and good research plan (the GRFP also requires broader impacts discussion). So it might be a good idea to wait until your second year to have research experience and even publication before applying. Remember, you're competing with the top PhD students at top universities worldwide.

Vu: PhD applicants at Mason are automatically eligible for a *Presidential Fellowship*. It is at least as good as GTA but the most important thing is that as a fellowship it is truly free money (i.e., you do not depend on any prof. or TA). Adcom members nominate applicants for this fellowship and the whole committee will decide.

In general, fellowships, especially those that are open to everyone, are highly competitive and prestigious, and you will stand out if you get one. Every PhD student has pubs, but only a few would have NSF Graduate (GRFP¹) or Microsoft fellowships. In fact, these are so prestigious that even if you didn't get it but make it to the final round or even "*honorable mentioning*", your school will still mention you on their website, and you should put it on your CV. §F discusses the evaluation processes of the NSF GRFP and DoD NDSEG.

12.3 Miscs

12.3.1 Low Stipend?

Students often think their stipend is too low and not enough to live on. For example, if you look at the stipend at Mason, which is around \$30K for 9-month, and then compare it to the cost of living in Fairfax, VA, which says you need \$70K to live in a 1-bed apartment, then you might be in a panic.

However, in almost all cases, the stipend is enough to live on. You might not be able to live in a 1-bed apartment by yourself, but you can live in a shared apartment or house with other students (most grad students shared apt). You might not be able to buy a new car, but you can use public transportation (actually, most my students buy a used car after being here for a year or so). In short, while the stipend is not high, it is not bad, and you can live comfortably with it.

In fact, it might be enough to support your spouse and kids. Many CS PhD students have their families with them (a student of mine lives with his wife and 1 kid in a 1-bed apartment and they are doing fine with just his stipend). So

¹<https://www.alexhunterlang.com/nsf-fellowship> is a good starting place for the GRFP with lots of proposal examples.

don't worry too much about the stipend. A good school would know that it has to be competitive to attract students. For example, at Mason, every year we try to improve the benefits, and especially stipend, for our graduate students.

For a full breakdown of how much a graduate student costs, see §12.3.3.

12.3.2 Funding In the Summer

Students often get confused about summer funding, e.g., if they will get paid during the summer. This is a good question because PhD students have no classes over the summer and so are often more productive and produce good research. However, summer salary is largely depending on your funding source.

First, recall that an academic year (AY), which consists of Fall and Spring semesters, is typically 9 months, so your stipend is for 9 months (and many places allow you to spread it over 12 months).

If your funding source is TA (§12.1.1), you typically do not get paid over the summer, which has few courses. Some CS departments offer summer funding, but it is not guaranteed and might not be a lot. For example, at Mason, we offer summer funding for 1st-year PhD TA students. The amount over the 3-month summer is similar to their monthly stipend (i.e., their 9-month stipend divided by 3 for the 3 summer months).

For RA (§12.1.1), it depends on your prof. and their funding. When writing grant proposals, profs. typically include summer funding for their students (§12.3.3). However, funding is never guaranteed, e.g., the prof might not get the grant.

Vu: For my students, I have been fortunate to have funding to support them over the summer. Over the 3-summer months, I typically pay them 1/3 of their 9-month stipend. I prioritize summer funding for my students because Mason has very good TA resources so they never have to worry about funding during the AY.

Finally, for fellowships (§12.2) you might get paid over the summer depending on your fellowship (§12.2). Good ones, e.g., from NSF, Google, and Microsoft, will pay you the whole year.

12.3.3 How much do you cost?

PhD students often ask why their salary is low compared to the large grants their advisers get. They also wonder why their offer letters sometimes show that their benefits are higher than what they receive (i.e., stipend).

Tab. 12.2: GRA cost breakdown. F & A is Facilities & Administrative Cost Base and MTDC is Modified Total Direct Cost. These are things that the university can charge overhead to.

Budget	Cost \$	Notes
GRA (9-month)	30K	
GRA (summer)	10	3-month, 20hrs/week
Total Salary	40K	
Health Insurance	3K	full year
Tuition (In-State)	15K	(\$680/ Credit + \$150/Student Fee/ Credit)* 9 credits = \$7470 (\$6120 + \$1350) per semester
Total Tuition & Insurance	18K	Full year tuition + insurance
Conference Registration	500	
International Travel	1800	
Domestic Travel	700	
Total Travel	3K	
Total Direct Cost	61K	Salary + Travel + Health + Tuition
F & A (MTDC)	21K	Direct Cost - GRA Salary
Total Indirect Cost	12K	58.9% of MTDC
Total (Direct + Indirect)	73K	Budget for a GRA

Tab. 12.2 shows the budget breakdown for a GRA per year. These numbers are based on my experience at public universities in the US. Private universities may have different numbers. For simplicity, I will assume the department has a 9-month stipend of \$30K and a 3-month summer of \$10K (a third of the 9-month stipend). I will also use Mason tuition rate of about \$15K/year for full-time study (which is quite cheap compared to private universities, e.g., Univ. of Chicago is a whooping \$70K) and a 58.9% rate on *indirect cost*, which is a typical rate charged for overhead or administrative costs (yes, after all, universities are businesses!). Finally, I assume the students take two conference trips per year, one domestic and one international (conf. registration, airline tickets, taxi, meals, etc are all included).

In the end, the total budget comes out to be \$73K/year to support a PhD student. *The summary is that over your 5–6 years of your PhD, you cost about*

\$400K, and while your stipend is X , your adviser probably pays $2X$ for you. But of course, the nicest thing is that you do not have to pay for any of this! You get to gain the knowledge, do research, travel, (and don't even have to buy any research or computer equipment as mentioned in §10.3) and also get paid!

Chapter 13

Choosing Schools

*“It’s not the school you go to, it’s
what you do while you’re there!”*

THE SIMPSONS

Choosing a school and an adviser is clearly among the most important things in your mind when you apply and especially when you get admitted. This is further complicated due to cultural differences and the unfamiliarity of international students with the US higher education system. This section aims to mitigate some confusion and help you make informed decisions.

13.1 Choosing a University

We will first discuss universities in the US that offer PhD in CS. Then we will talk about how to select them.

13.1.1 Schools offering PhD in CS

Most US universities have CS programs, but many of them do not have a CS *PhD* program. These universities might offer just Bachelor’s degrees (e.g., BS) and no graduate studies (i.e., no MS or PhD degrees), or they just offer MS programs (but no PhD). For example, Penn State in University Park has PhD in CS, but Penn State in Harrisburg only has BS and MS in CS, and Penn State in York only has BS in CS. On the other hand, multiple locations of the University of Texas, e.g., Austin, Dallas, and Arlington, have PhDs in CS.

Thus, if your goal is PhD in CS, you have to aim only for schools offering such a degree. While this can be confusing due to the large number of universities in the US, a little research, e.g., searching for PhD in CS from the school website, will help you find out. Schools listed in §H have PhD programs in CS, so you can start there.

13.1.2 Selecting and Ranking Schools

Many students put universities into two bins: (i) top schools that they dream about, and (ii) everything else. They often use rankings from US News, which is not transparent and questionable¹. Sometimes they evaluate based on the reputation of the school's undergrad program or the reputation of the school's non-CS programs such as medical, math, or physics. Many international students rank universities based on popular places they know in the US, e.g., California, Texas, and New York.

Instead of these superficial criteria, you should specifically consider the CS program and the research interests of faculty members. You can learn about these using resources such as [CSRankings.org](https://csrankings.org). You will be very surprised to learn that a school that you didn't know much about can have very strong research in your topic (and vice versa, a school you thought highly about might have no faculty working in the research field you're interested in). This is also a good way to learn about individual faculty, e.g., who works on what, and well-known CS conferences².

Dat: Most Vietnamese students, including those from top schools, **do not know** about CSRankings. Maybe applicants who worked at top research places such as VinAI would know about it.

What matters to you? While many find CSRankings useful, it is still superficial as every other ranking. You should consider other factors that matter to you. For example, you might prefer places with a large community from your country (e.g., Northern VA has a large population of Vietnamese). You might prefer places with high-tech companies (Seattle or Silicon Valley), with many outdoor activities (e.g., hiking, skiing), or with better weather (*"PhD can be depressing, so would you rather be depressed in California or New York?"*). You might need to think about the cost of living, e.g., living in California is more expensive than in Virginia, or places with

¹<https://cra.org/cra-statement-us-news-world-report-rankings-computer-science-universities/>

²In CS (and probably only in CS), conferences, not journals, are often the main venue to publish research findings (see [why here](#)).

high crime rates (note that while some universities might be in a high-crime city but the campus itself is safe).

If you get admission to several places, you should consider attending Open Houses (§10) and contact profs. that you're interested in at those places and talk to them. They would be more willing to chat with you now that you have been admitted. Ask questions about [their work](#), how they manage students, and their expectations. You can even ask to contact their students.

Hung: I always encourage the students I admit to talk with my students and the students of other faculty in other schools who admitted them. You will unlikely hear straight-out complaints from current students in a prof's group. But sometimes what is important are things that they (current students) don't tell you. Pay attention to their "level of excitement" being in the group.

Xiaokuan: Chinese students often only look at US News rankings when selecting their PhD universities (I did that, too, when I was applying for PhD positions). Now that I am a professor, I find it to be the least promising way. The reason is that US News does not provide a good metric for evaluating the quality of the PhD program. If you want to do great research, CSRankings is the best way to find good and active professors (which did not exist when I was applying), since it solely focuses on publications at top-tier CS conferences. Also, I think PhD is not only about research; you need to also consider your daily life there since you will (probably) stay for at least five years. You might regret it if you did not consider this seriously before applying.

13.1.3 PhD in other related fields: CE, IST, Cybersecurity

You *do not* need to do a PhD in CS to work in CS areas. For example, in addition to a traditional CS department, Mason has IST and Cybersecurity departments, both of which have faculty with PhD in CS and work on CS topics (e.g., AI, Security, Robotics). So you still can do CS research and publish in CS-focused venues even if you're not in a traditional CS program. It is common to see faculty with PhD in CS in a non-CS department as well as faculty with non-CS PhD in a CS department.

However, if your goal is a PhD in CS, then you need to be in the CS dept *and* advised by a CS faculty. A non-CS faculty can serve in the PhD dissertation committee (common) or *co-advise* (somewhat rare), but your main PhD adviser will likely be a tenure-line faculty in CS (§14.2). For example, a prof. in Stats or Math might be able to serve as a co-adviser, but not as a sole adviser of a student in a CS PhD program. If in doubt, check with the CS department for their requirements.

For this specific reason, CSRankings includes only faculty who can advise CS PhD students. I also have compiled a [list](#) of Vietnamese faculty who can advise PhD students. §14.2 talks more about who can serve as your PhD adviser.

Chapter 14

Choosing an Adviser

*“It’s not easy being a mentor.
But it sure is funny to watch
other people screw up.”*

THE SIMPSONS

There is no one-size-fits-all answer to finding an adviser. The best adviser is the one that you can work well with. But how do you find such a person?

Fortunately, while some non-US programs require finding an adviser and research topic before starting the PhD (§1.5), CS PhD programs in the US will typically give you a couple of years to “shop” for advisers and research topics. This is especially true if you’re admitted with TA (§12.1.1), which gives you time to explore and find an adviser.

14.1 Finding an Adviser

Assuming you’re not familiar with any particular one, then first search for profs. that share similar research interests. For example, in CSRankings, if you want to work with PL, you can search for those published in PL conferences. If you want to work with SE *and* AI, you can search for faculty who work in both SE and AI. Then you research about that prof. (e.g., go to their website) and contact them (§14.5).

Xiaokuan: Whether the student’s research interest matches that of the adviser is very important; if there is a mismatch, either the student or the adviser has to make compromises, which often leads to disagreements or conflicts. IMO, the adviser should be the one who *guides* students to do research while allowing students to pursue their own interests, instead of *dictating* their research.

Another way is taking graduate-level courses in the topics you are interested in. Many profs teach *special topics courses* and *research seminars*, and they might be recruiting students. Do well in the class, answer questions, talk to the prof.

after classes, etc—being stand out. Many profs, including myself, prefer taking in new students this way. It gives both the prof and student more time, e.g., a whole semester, to work and evaluate the relationship before making any commitment (sounds like a marriage!).

You can also ask to do an independent study or research with a prof. This can be informal (no credits) and takes place during the summer or winter break. For example, I do this with several students, some of whom are undergrads. Many will drop out because they find they don't like my research, but some find that they like the work.

Ultimately, choose a prof. that fits you by communicating with them, taking their courses, meeting and asking them questions, and talking to their current students. It will take time and effort, but since you will be working with this person for 5+ years, it is important to try to find the right one.

Thanh: In my opinion, having a well-suited adviser is crucial for a successful PhD and research career. One effective approach to finding a suitable professor is by working with a professor during your undergraduate studies. An exemplary instance is VinAI's residency program, where residents collaborate with professors from the US for two years before applying to PhD programs. Many VinAI residents have achieved remarkable results and gained admission to prestigious US universities. Unfortunately, VinAI's resident program is limited to AI research. In other fields, e.g. Software Engineering, Vietnamese students face challenges in reaching US professors. Do you have any tips for Vietnamese students who want to connect with US professors and work as research assistants?

Vu: §14.5 shows how to contact a professor for research opportunities. Many will say no (or do not reply) as they do not have the bandwidth to take on random students, but some may say yes if they see a potential fit.

- [The Definitive “what do I ask/look for” in a PhD Adviser Guide](#)

14.2 Who can serve as a PhD adviser?

Not every faculty can serve as your official PhD adviser. Let's try to understand the different types of faculty and their roles. For example, you might hear about tenured, tenure track, and teaching faculty. You might also hear about assistant, associate, full, adjunct, emeritus, teaching, and research professors. Here is a primer on these terminologies.

Faculty There are typically two types of faculty at an R1 research university: tenure-line and teaching. The main difference is their focus: research, teaching,

or both. Tenure-line faculty are typically more research-focused and can mentor PhD students, while teaching faculty are more teaching-focused and typically do not advise PhD students. Thus when contacting a prof. for research opportunities (§14.5), you should focus on tenure-line faculty (and not adjunct or emeritus :p).

Tenure-line faculty, consisting of tenured and tenure-track profs., focuses on research, which includes publishing papers, obtaining grants, and mentoring PhD students. They often have a low teaching load, e.g., 1 course per semester. *Tenured* faculty are professors who have been promoted to permanent positions (informally, very hard to fire them). *Tenure-track* faculty are professors who are on the track to get tenure. For most schools, tenure-line is the main type of faculty that can serve as a formal adviser of PhD students. §14.3 talks more about choosing between tenure and tenured-track professor as your adviser.

Teaching faculty, sometimes called instructional faculty or professor of practice, mainly focuses on teaching. They typically teach 3–4 classes per semester (which is quite a lot) and *do not* have research responsibilities, e.g., they do not have to worry much about publishing papers or obtaining grants. As such they typically do not have funding (e.g., RA §12) to support PhD students. Depending on the university, they might be able to *co-advise* and mentor PhD students with a tenure-line faculty, but they typically do not formally advise and graduate PhD students.

Note that at many universities do not allow *non-CS profs*, even tenure-line ones, to solely advise and graduate PhD students in CS (see §13.1.3).

Some universities have *research faculty* or research scientists, who are typically non-tenure line faculty and focus on research (e.g., publishing papers and getting grants). They can recruit students and provide RA funding for them. They can also teach classes but typically have a lower teaching load. For some universities, they *can* solely advise and graduate PhD students, but for others, they cannot.

Adjunct faculty is not full-time, e.g., they might be working in industry and teach a class or two for fun. *Emeritus faculty* means they are retired from the university, e.g., they could move to the industry, but still have some affiliation with the university. Due to their roles, these profs. typically do not advise PhD students.

Vu: This Reddit [thread](#) talks about about a student getting rejected for listing emeritus professors in their SOP (potentially they list these retired profs. as their potential advisers, and this shows to adcom that they do not do their homework on the faculty at the school). This is a good example of how students can make mistakes by not understanding the roles of different faculty types.

Ranks Faculty have ranks such as assistant, associate, and full, regardless if they are tenure-line or teaching. Assistant means new faculty, associate means they have been promoted (or was hired after being in the industry for a while), and full means they are senior.

Typically, a tenure-track faculty starts with being an assistant professor and then

gets tenure and promoted to associate (around 6 years). Note that getting tenure is a huge deal, and it might change the way they work with students (§14.3).

After that they go up for full prof. (time varies, some become full within 3–4 years, some 10+ years, some remain associate). A non-tenure track faculty, e.g., teaching or research faculty, also starts with Assistant, then is promoted to Associate, and finally Full.

14.3 Tenured or tenure-track faculty?

Now that you know a bit about tenured and tenure-track faculty (§14.2). Which one should you choose as your adviser? Either can be a good adviser, but they have different strengths and weaknesses.

Tenure-track faculty, e.g., assistant professors, are likely young and active in research (they have to, to get tenure). Thus, they will devote more time to work with you and push you to do research and publish. However, you might not be too independent when you graduate because they have been too hands-on with you. Also, they may not have as much experience in managing students and may not have as much funding (yet).

Tenured faculty, e.g., associate and full profs., are likely older, more well-known, and have more experience in managing students. However, they might not push you as hard and expect you to figure things out yourself, i.e., you need to be independent. Some tenured faculty are also no longer active in research and are more involved with administrative responsibilities or with their startup companies (this means they will likely not take new students). §14.2 gives more details on faculty types.

14.4 Research Achievements

While a strong match in personalities and research interests is important, many students also consider the faculty's research achievements. The general metrics are papers, citations, students (current and graduated), etc. However, these metrics might not be accurate (e.g., in AI/ML, even students often have a lot of citations because the field is hot and many people cite their papers).

Thus, you should look beyond these metrics and consider the quality of the work and their impact on the field, and the reputation and the ability to obtain funding from the faculty. These are typically measured by prestigious awards and recognitions, which are often more important than the number of papers or citations and highlighted in their CV and even on the department or university website.

Prestigious Career Awards & Recognition Highly productive researchers often receive competitive career awards that recognize their long-term potential. Some of the most prestigious awards include:

- **NSF CAREER Award (US)** – A significant early-career award given to faculty demonstrating research and educational excellence.
- **Sloan Fellowship** – Recognizes young faculty with exceptional potential.
- **DoD YIP (Young Investigator Program)** – Awarded to early-career researchers in defense-related fields.
- **ACM/IEEE Fellows** – Reserved for researchers with long-term contributions and leadership in computing fields.
- **Turing Award** – The highest honor in computer science (if your potential adviser has one, you already know they are a giant in the field).

These awards indicate long-term impact and recognition from the research community. If an adviser has received any of these, it suggests a strong reputation and high research productivity.

Research Awards & Long-Term Recognition Awards for research impact—especially those that recognize work over time—are strong indicators of high-quality contributions. Examples include:

- **Test of Time Awards** – Given to papers that have remained influential over a decade or more.
- **Most Influential Paper Awards** – Typically awarded at major conferences for research that has shaped the field.

- **10-Year Impact Awards** – Recognizing papers that have had sustained influence over a decade.

If a potential adviser has won one or more of these, it means their research is not just productive but also has lasting significance.

Development of Highly Influential Research Tools Beyond papers, research tools that are widely used in academia or industry signify real-world impact. Some key indicators include:

- **Tools used in major companies or open-source projects** – If a tool from their lab is integrated into industry workflows (e.g., compilers, verification tools, ML frameworks), it’s a sign of practical impact.
- **Winning research competitions** – Many fields have benchmark competitions (e.g., SAT solvers, automated theorem provers, AI competitions). Winning or being a top contender in these suggests that the lab is leading cutting-edge research.
- **Tools included in major software stacks** – If a tool is widely cited or included in standard toolchains (e.g., LLVM, Z3, TensorFlow), it indicates strong adoption.

Some departments list major research awards and influential software projects on their website. If an adviser’s name appears frequently in such lists, it’s a strong endorsement of their impact.

Research Publications in Top Venues While individual papers can be impressive, a more reliable measure of a researcher’s productivity is the **sum of their publications in top-tier conferences and journals**.

- Look for publications in the highest-impact conferences of the field (e.g., NeurIPS, ICML, CVPR for AI/ML; PLDI, OOPSLA, POPL for programming languages; FSE, ICSE for software engineering).
- Be cautious about citation counts—fields like AI/ML generate high citations quickly, even for unpublished papers. Instead, focus on where and how often they publish.
- A high volume of recent publications in top venues suggests an active and productive lab.

External Research Grants & Funding The ability to secure funding is a sign of research productivity and lab stability. Some key points to consider:

- **Total external funding secured** – NSF, DoD, DARPA, NIH, and industry grants indicate strong research backing.
- **Large collaborative grants** – Leading multi-institution projects suggests strong connections and influence.
- **Consistency of funding** – Advisers with multiple ongoing grants can better support students with travel, equipment, and stipends.

If an adviser has continuously secured funding over time, it suggests a stable research environment and long-term support for students.

Leadership & Service in the Research Community Serving in key leadership roles is another indicator of a researcher's standing in the field. Important roles include:

- **General or Program Chair of major conferences** – Running top conferences like NeurIPS, ICSE, or PLDI requires respect from peers and shows leadership.
- **Editorial roles in top journals** – Being an editor of a leading journal (e.g., ACM TOCS, IEEE TSE) suggests authority in the field.
- **Departmental leadership roles** – While not always a direct research indicator, serving as Department Chair, Dean, or leading a research institute often signals strong influence.

What This Means for You as a PhD Student Evaluating these factors helps you understand:

- **How well-known your potential adviser is in the field** – This impacts your career prospects after graduation.
- **How active their lab is** – A productive lab means more opportunities for collaboration, funding, and conference travel.
- **How stable the research funding is** – A well-funded lab ensures you have the resources you need to succeed.

While no single factor is definitive, a combination of these elements can give you a strong sense of whether an adviser and their lab are truly productive and well-respected in the field.

14.5 Contacting a Prof. How to get a desired reply?

Faculty often receive “cold” e-mails from prospective students. Most of the time, we ignore these emails (§14.5.3), but on some rare occasions, we do answer them. So how to write an email that gets our attention?

First, if you want to contact a prof. to *ask about your admission chance*, please **don’t**. We don’t know and can’t answer because as explained in §2, we don’t make individual decisions and might not even be assigned to evaluate your application. It is the same as sending a paper draft to a journal editor and asking them if your paper has a chance.

So how to get someone to look at your profile and give input? You could ask your professors, LoR writers, collaborators, or those who have previously applied. For this kind of feedback, ask someone you have a personal connection with.

On the other hand, if you want to contact a prof. to ask about *research opportunities*, or *GTA/GRA* support, then *yes*, I believe you should—it is *worth it*. However, you really need to put effort into it and do it the *right way*.

First, read the prof’s website, and see if they say something about contacting them. Many profs. explicitly state how prospective students should (or should not) contact them, e.g., using specific email subjects. In general, the best way to catch the prof.’s attention is to *customize your email* for them. For example, read their papers, know what they work on, and see if you are interested in their research. Then email them and talk about how/why their work would match yours. In contrast, if you write a generic email that can be sent to multiple professors (e.g., if you just change some names and keywords in the email or copy and paste paper titles), you will not get a response.

Below is a good example that I would likely reply.

Dear Prof. Nguyen,

I am writing to inquire about potential research opportunities as a GRA in your group at Mason. Currently I am an undergraduate student in Computer Science at UNIV and plan to graduate in May 2023.

I have read your TSE'21 paper on numerical invariant generation, and I am interested in this line of dynamic invariant research. I have worked (optional: with prof. Y at Z) on static program analysis and I think it could be used to tackle the spurious issues mentioned in your paper. I have a short paper at conference/workshop C and a project on symbolic execution (Github repo G).

...

This is a good example because it is written just for me. It shows that the student knows about my work on invariant generation and has a related background (paper C and project G).

Finally, profs. are very busy so don't take it personally if you don't get anything from them (though I would be very surprised if such thoughtful emails get no replies!). See §14.5.1 for common mistakes in emails and §14.5.2 for interpreting replies.

Xiaokuan Applying for PhD and contacting a potential PhD adviser is a classic ‘**why me, why you**’ problem, similar to looking for a job in a company. On a high level, you need to show that you have done your *homework* regarding the professor and the university, and clearly explain: 1) why do you think you are a good fit in professor A's group? 2) why do you want to be advised by professor A, not B? 3) why do you want to apply for university X, not Y? If you don't want to spend time doing your homework, the chance of getting a reply is close to zero.

Deepak: In my view, cold emails are not welcome by most faculty members and should be avoided. However, if one is already admitted to a program in some department, by all means, email the faculty you may be interested in working with, but do mention right at the beginning that you are already admitted to the program as well as several other universities. State specific areas (preferably specific topics-ML, robotics instead of AI).

Additional Resources

- [A Note about Emailing Professors](#) by Yonatan Bisk
- [§10.1](#) How to accept/postpone/decline PhD offers (and do it gracefully)

14.5.1 Kiss of Death in Emails

- **Send emails to the wrong prof..** Many students do not pay attention or know about this, but a very common reason why you don't get a reply is that you send email to profs. who do not / cannot advise CS PhD students (e.g., adjunct, emeritus, teaching, non-CS). See §14.2 for details. While these profs. might be able to co-advise, they typically do not have the bandwidth, funding, and the desire to mentor students for research (they are already overloaded with teaching and other service duties).

So do some homework before sending emails, e.g., most CS profs. who are active in research will have a website with their work (publications) and students; some also have lab website dedicated to their group. Most teaching and adjunct profs. do not have a research group or students listed on their website.

- **Generic.** You should already know this! A copy and paste kind of email or those that can be sent to multiple people with very little modifications show the lack of interest and will be treated as spam. Most likely we will not reply to these emails.
- **Self-focus.** Focusing too much about you and your achievements but not why you are interested in the prof.'s work (§14.5). Mention why you're interested in their work and how your background can contribute.
- **Too long.** Keep it to about 3–4 short paragraphs. Less is more and too long emails are often not read and discarded. Don't attach course transcript or test scores in the first email. If they are interested they will ask for them. Attaching CV is OK. Sample papers (§8.2) and links to your Arxiv papers or GitHub projects are also OK if they are relevant.
- **Flowery greetings and language.** Don't use "Dear esteemed professor". Do not call the prof. by their first name in the first email (some don't care but you don't want to take the risk – you don't know them that well yet). Do not use Mr., Mrs., etc. To be safe, use Prof. Lastname or Dr. Lastname (§15.4).
- **Ignoring the Prof's guideline** and asking questions that are already answered on their website. Many profs. put very specific information on how to contact them on their website (e.g., email subject, what to include). Following this helps you stand out and increase your chance of getting a reply.
- **Fancy format.** Do not use colors, fancy fonts or formats. While not really a kiss of death, it is very annoying, especially for people in CS (and probably many other fields) who often prefer plain messages.
- **Mass emails.** I've seen it many times when a student mass emails all profs in a department (e.g., through CC or even BCC—we know because faculty

talk to each other). This will result in no reply or a very harsh one on how unprofessional you are.

- **Do Not Call.** Not related to email but sometimes students get desperate and call the prof. This is a big no-no, especially for CS ppl who often prefer email over phone calls.

14.5.2 Interpreting Response

Even if you avoid the kiss of death emails (§14.5.1), you might still not get a reply. This is very common and you should not take it personally. There are many reasons why you might not get a reply, e.g., the prof. is not interested, they are too busy (§14.5.3), they are not taking students, they are on vacation, etc. Here are some common responses and what they mean:

Some generic responses are:

- **No reply.** This is by far the most common response (see why in §14.5.3). It means they are not interested. You might try again in a few weeks or months, but don't expect a reply. And after a couple of tries, you should move on. It simply means they are not interested.
- **Not taking students but encourage you to apply.** Polite way of saying not interested and referring you to the admission process. Note that this does not in any way mean that they think you have a good chance of getting admitted.
- **Not taken student this year (but encourage you to apply next year).** Polite but generic response. And like the previous one, encouragement to apply does not mean they think you have a good chance of getting admitted.
- **Come talk to me after you're admitted.** Generic. Refer you to the admission process. But if you get admitted then you can reply to them and say you're admitted and would like to talk.
- **Cannot admit you directly. Need to go through admission process.** Generic. They are not interested and refer you to the admission process.
- **I am not taking students but I co-advise/can serve on your committee.** While this might sound good, it's still generic because it says *once you're admitted and have an adviser*, then contact me again.
- **I am not taking student but Prof. X might be.** Not common as most profs. will not refer you to their colleagues. However, this is better than the previous responses. While they cannot take you, they think you are a good fit for X. So follow up with a thank you and say you'll contact X. And then contact X and say that Y referred you to them.

In short, all of these replies mean the prof. is not interested. The best positive response is that they want more information from you, e.g., your CV, transcript, paper, or a chat (like an interview).

14.5.3 Are profs. so busy that they completely ignore emails?

Profs. are busy. We have many deadlines, meetings, and emails, many of which are from prospective students looking for research opportunities. we also have a life outside of work, e.g., family, hobbies, etc.

However, this is *not* why we “ghost” you and provide no response (§14.5.2). It is because we want to avoid misunderstandings. A response (§14.5.2), no matter how clear we think it is, might be misinterpreted by the student. For example, if we say we are not taking students but still (strongly) encourage to apply, then the student might take it as a positive sign of admission. Or if we say we are not interested, the student might take it as a personal rejection and not apply at all. So it is not because we are too busy to reply, but because we do not want misunderstandings and have to deal with them later.

Vu: I skim through *every email* sent by students for admission and research opportunities (many of which are from undergrads and highschool students). So that means I do read your email, and it doesn't go to my spam/trash folder. However, I only reply to those that I think are a good fit and ask them to chat with me.

Part V

Miscs and FAQs

Chapter 15

Miscs and FAQs

“I want to share something with you – the three little sentences that will get you through life; number 1: Cover for me, number 2: Oh, good idea, Boss, and number 3: It was like that when I got here.”

THE SIMPSONS

15.1 “Chance me” on getting admitted to T10 programs

Many international students aim for very top schools such as Stanford and MIT, and Ivy Leagues. Every year Reddit and other forums have numerous students asking for evaluation of their chances of getting into these schools (the so called “*chance me*” or “*roast my CV/profile*” posts) and then later posts on being “*ghosted and rejected everywhere*”.

You are unlikely to get in these schools While being ambitious is always good, it is important to be realistic, and the harsh reality is that it is very unlikely that you will get in MIT or Harvard unless you are very exceptional (in which case you would not be asking for chances on Reddit).

People who do get in these schools often were explicitly encouraged by their mentors and LoR writers, who themselves might be alumni of these schools or are academic celebrities who’ve sent many of their students there. If you are not in this category (doubt you are, because you’re asking random people on the internet instead of your trusted LoR writers), then you’re likely not going to get in, and MIT and Stanford would gladly take your application money.

“Your” top might not really top in CS Harvard and the Ivies? yes good for many things but usually not coding marathon and typically MIA at top CS confs (ok, they are still good, but a school somewhere in Maryland, Wisconsin, or Urbana Champaign cornfield would likely beat them by far in CS). MIT and Stanford? yes, they are top, but many are equivalent, and there could be CS areas where they are not as strong as other schools. Caltech and John Hopkins? ... are you confused CS with Physics and Medicine?

You’re missing out some serious places: UCSD, UW, UMD, Michigan, Purdue, Stony brook. These all have super strong CS programs but rarely get mentioned. Utah, Rutgers, Buffalo, Penn State, UVA, Ohio, UC Riverside, George Mason ... any of them rings a bell? These might not ranked very high on QS or US News and are not household names to you, your friends, mom and dad, but they are excellent CS schools where graduating students from your dream schools often apply for faculty positions (e.g., see [GMU stats](#)). You can go to these places and be superstar there.

You don’t need to be top Top schools will open doors to more opportunities. In countries like Vietnam, there are usually only a few top schools, and if you don’t get into them, you are doomed (or so you think). But that is not the case in the US. There are simply too many good schools, and it is not a binary choice between top X or nothing. In fact, “equity” is emphasized in the US and “smaller” schools are often given more resources and attention to help students succeed.

In short, don’t aim for just the moon and the stars, also try the sky, clouds, or even just the trees. You might find much happiness and success there, which then can catapult you places beyond the moon and the stars. This is the American dream, which is strongly embodied in the its higher education system.

15.2 How long does it take to evaluate an application?

In the schools I’ve been at, the application deadline is in Dec, and adcom meets when school starts in mid or end of Jan. Adcom chair sends out review assignments to adcom members, about 30ish per faculty (§2.1). We usually have about 2 weeks to review all applications. As mentioned in §2.4, adcom members review applications individually and independently. We only discuss when there are disagreements (adcom chair will determine which applications to discuss).

I typically reserve a whole day (or two days) to review all applications. On average, I spend about 10–15 minutes reviewing each application (less for clear rejections and more for potential acceptances). While this seems short, it is not that difficult to tell if an application is good or bad. In fact, this is twice what other faculty spend on average, e.g., Philip Guo spent [3–5 minutes](#) per application.

For each application, our system compiles a single PDF file, which consists of a summary (degrees, GPAs, etc), transcripts, test scores, LoRs, a CV, SOP, and

writing samples. I usually read in this order. I start with the *summary*, checking for low GPAs or test scores below the university minimum (§7). I then skim the *transcripts* for low grades in relevant courses, noting issues like “many low grades in main courses or unknown international school with good GPA”. These are not as important as LORs or SOP but I read them first because the review system has questions about them (e.g., “is GPA good? is IELTS sufficient?”)

I read carefully *strong LoRs* and skim weaker ones, noting either strong letters from well-known professors/researchers and talk about research experiences or weak letters with generic content (e.g., “student was in my class”). I skim over *CV* and look for publications, research experiences, and notable achievements. I take notes of things like “published papers in top venues” or “gold medal in an international competition”.

I skim weak *SOPs* but read strong ones carefully. I note whether the SOP is exciting, research-oriented, standing out, and tailored to our program (e.g., if they are familiar with the work of some faculty or have talked to them). These notes are entered into the evaluation system.

Finally, I enter my decision, which is usually either a rejection or an offer of admission with full funding (e.g., from TA). I also recommend very strong candidates for the University Presidential fellowship, which is a fellowship from GMU that provides funding similar to an RA (§12). Note that while the system has other decision options, eg., admit without funding, provisional admission (e.g., if they need to take some courses), I do not use them, simply because we either reject or admit with funding.

Note that I *do not* need to interview a student to make a decision. I can tell from the application if they are strong or not. However, if I want to recruit a student, I will ask them to chat with me. This is quite different than in other discipline where reviews, interviews, and selection are done in multiple rounds (see §2.4 for an example in Physics).

Of course my recommendation is just one of the three or four faculty who review the application. The adcom chair will compile all recommendations and make a decision based on them (§2.4). If there are disagreements, adcom chair will ask the reviewers to discuss the application. Unfortunately, even if all reviewers recommend a student, they might not be admitted (§11.2) if there are too many students or they are not a good fit for the program (e.g., no one is willing to advise them).

15.3 Checking for AI in SOPs

As AI/LLM’s become more popular, many students wonder if they could use it to help with their statements and university/adcom reviewers would check and penalize AI-assisted writing.

While I cannot speak for others, I do not check your statements for AI contents. First, I do not have the time to do that. It is much easier for me to just read the

statement and see if it makes sense and stands out (§15.2). Hint: AI-generated content reads very strangely and faculty is just too experienced in reading essays and SOPs from students to not notice it. Second, AI-checking technology is very unreliable and inconsistent (e.g., a checker might claim that 80% of an essay is AI-generated while another says it is 0%). Third, while it is not OK to use AI to write your statement (as it is both easy to detect and just feels wrong), I think it is fine to use it to help you polish your writing, e.g., the “proofread” feature in Apple’s Writing Tools is quite useful for fixing writing issues.

15.4 How to call or address a professor?

If you’re reaching out to a professor for the first time, address them as Prof. or Dr. LastName (if they do not have a PhD, then use Prof.). Many international students use Prof. or Dr. FirstName LastName, but this can come across as if you’re simply copying and pasting names. So just stick with Prof. or Dr. LastName. Using Prof. is generally the safest option.

Furthermore, do not use Mr., Mrs., Ms, or Miss. This happens rarely, but I have seen new students (e.g., undergraduate freshmen in the US) sometimes use these, which are used in K-12 schools but not in higher education.

Moreover, do not call the prof. by their first name at first. As you become more familiar with your prof and depending on their preferences, you may transition to

addressing them by their first name. For example, I prefer that my students and colleagues call me Vu. Some students call me *Dr. Vu*, which I find a bit amusing but am totally fine with it.

Kapur: I was amused to read this as if I recall correctly, you never called me by my first name when you were at UNM. You always called me Prof. And, many times, I would jokingly call you back as Prof. Vu.

Vu: Yes, for some reason I enjoy calling you “Professor” (without appending a last or first name). The use of Prof. Vu may have foreshadowed my future in academia.

Note that in some universities the formal title Dr. Lastname is preferred over Prof. Moreover, be aware that not all faculty members may hold a PhD, in which case using Prof. Lastname is a suitable alternative. You just need to observe and follow the conventions at your particular institution. One way to determine how to address a professor is to observe how they sign their emails or how they introduce themselves in class. For example, I introduce myself as “Vu” in class.

Referring to professors you know When referring or talking about a prof (e.g., your mentor) that you know, you can just informally use their names if they are OK with it as mentioned above (or Dr./Prof., if you want to be formal). You can also include their institution if it makes it more precise. For example, I can say: *“I did my postdoc with Jeff Foster at Univ. of Maryland”*.

Do not include ranking (§14.2), e.g., Assistant, Associate, Scientist, ..., when referring to someone. I see many international students include a lengthy title of people they know, e.g., *I am advised by Asst. Prof. X, and I also collaborate with Distinguished Scientist Y*.

This is *not necessary* and makes it look like you’re trying to show off your connections. These nuances represent some cultural and academic differences that you may encounter and will gradually adapt to. More on these differences in §G.

Part VI

Appendices

Appendix A

Glossary

ABD All But Dissertation. A PhD candidate who has finished all course work and exams and only needs to write and defend their dissertation.

Adcom §2 Admission Committee. The group of faculty members who review applications and make admission decisions.

Adcom members §2 Faculty members who are part of the admission committee. These are the people who review applications and make admission decisions.

Adcom chair §2 The faculty member who leads the admission committee. This person is often not involved in individual admission decisions but oversees the process (e.g., resolve disputes, ensure fairness).

Adviser/Supervisor : A faculty member who guides and mentors a PhD student throughout their research. This person typically plays a crucial role in a student's academic journey. In the US, the term “adviser” is more commonly used than “supervisor”.

Cohort A group of students who start a program at the same time and take classes together. You should get to know your cohort as they will be your colleagues and friends during your PhD.

Deferred Admission An option allowing admitted students to postpone their start date, typically by one year.

Diversity Statement §5.2 A document sometimes required in applications where applicants describe their contributions to diversity and inclusion, or how their background adds to the diversity of the academic community. This document is often required for faculty positions, but some universities are requiring it for graduate admissions. Note that you do not need to be from an underrepresented group to write a diversity statement.

Field or Area A specific research area, e.g., Machine Learning, Computer Vision, Software Engineering, etc.

International vs. Domestic students International students are loosely defined as those who would need a visa to study in the US (§B). Domestic students (§C) are those who do not need a visa, typically US citizens or permanent residents.

In-state vs. Out-of-state In-state tuition is the tuition rate for students who are residents of the state where the university is located. Out-of-state tuition is the tuition rate for students who are not residents of that state. In-state tuition is typically much lower than out-of-state tuition. PhD students typically do not have to pay tuition as it is covered by their funding, but this might be important for MS students.

Ivy League A group of eight private universities in the US known for their academic excellence and social prestige. The Ivy League schools are Brown, Columbia, Cornell, Dartmouth, Harvard, the UPenn, Princeton, and Yale. These schools are typically known for their undergraduate programs more than their graduate programs. Moreover, most top CS programs such as CMU, UIUC, UCSD, UWash, MIT, Stanford, are not in the Ivy League. See selecting and ranking schools in §13.1.2.

Lab Research Lab. A group of researchers (profs. and students) working on a common research area, e.g., a Software Engineering Lab. Typically a lab is led by a single professor, but sometimes it can be co-led by multiple professors. For example, my lab DynaROARS focuses on my own research area (software verification), but I am also part of the more general SWE Lab at Mason with other faculty in Software Engineering.

LoR Letter of Recommendation. A letter written by a professor or supervisor that assesses your qualifications and potential for graduate study (§3).

Major A student's primary field of study, e.g., Computer Science, Electrical Engineering, Mathematics, etc. Often used in the context of undergraduate studies (e.g., "what was your major in undergrad?").

MS §1.4 Master of Science. A graduate degree that typically requires 2 years of study.

Open House §10 An event where admitted students visit the university to meet faculty, students, and staff, and learn more about the program. This is a great opportunity to get a feel for the university and the department and decide if it is a good fit for you.

- Q1 Journal** Commonly mentioned by international students to refer to top-tier journals in CS. This is not a standard in CS in the US (which often focuses on confs. rather than journals), and many CS faculty in the US might not know what this means. If you want to refer to top-tier journals, you should mention the specific journals, e.g., TSE in Software Engineering.
- SOP** Statement of Purpose is a document written by yourself to explain your research interests, background, and reasons for applying to a PhD program (§5).
- RA and TA** Research Assistantship (RA, §12.1.2) is a funding where you work on a research project for a professor. Teaching Assistantship (TA, §12.1.1) is a funding where you help a professor with teaching (e.g., grading assignments).
- TOEFL/IELTS** Test of English as a Foreign Language. A standardized test to measure the English language ability of non-native speakers.
- GRE** Graduate Record Examination. A standardized test that is an admissions requirement for many graduate schools in the US. However, it is not required for most CS PhD programs (§7).
- PI** Principal Investigator is lead researcher on a grant or research project, e.g., a PI on an NSF grant. Prospective students often use this term to refer to a professor they are interested in working with. However, we do not use it this way in academia, e.g., “who is your PI?” might only make sense to fellow Reddit applicants, but might not be understood by others, “who is your adviser?” is what you want to use.
- STEM** Science, Technology, Engineering, and Mathematics. Fields in or related to these areas are considered STEM fields. CS is a STEM field.
- URM** Underrepresented Minority. Refers to groups that are underrepresented in higher education, e.g., Black, Hispanic, and Native American students.
- NSF** National Science Foundation. A US government agency that supports research and education in science and engineering. NSF is a major source of funding for RAs in CS research. There are other agencies that support RAs but they might require US citizenship or permanent residency.
- R1/R2 Universities** Research 1 (R1) universities are universities with the highest level of research activity. R2 universities have a high level of research activity but not as high as R1 universities. R1 universities are typically larger, and have more funding and resources for research. R2 universities are also good but might have fewer resources and funding.

Rolling Admission Applications are reviewed as they are received (instead of all at once after the deadline), and decisions are made throughout the admission cycle. Rolling admission is more common for MS programs and less common for PhD programs (e.g., at Mason, MS is rolling and PhD is not).

Top-tier conferences and journals These are the most prestigious venues for publishing research in CS. For example, in Software Engineering, top-tier conferences include ICSE, FSE, and ASE and top-tier journals include TSE and TOSEM. Publishing in these venues is highly competitive and prestigious, and can significantly improve your chances of getting admitted to a good PhD program.

Stipend A fixed regular sum paid to students as part of their funding package (i.e., salary). This is typically paid monthly or bi-weekly. Stipend is typically paid to PhD students and not MS students.

REU Research Experience for Undergraduates. A program funded by the NSF to provide research opportunities for undergraduate students.

OPT Optional Practical Training. A program that allows F-1 students to work in the US for up to 12 months after graduation.

CPT Curricular Practical Training. A program that allows F-1 students to participate in internships or practical training that is an integral part of their academic curriculum.

F-1 Student Visa. A visa that allows international students to study full-time at an accredited institution in the US.

F-2 Dependent Visa. A visa that allows the spouse and children of an F-1 visa holder to live in the US.

Appendix B

Visa for International Students

*“I didn’t do it. Nobody saw me
do it. You can’t prove anything!”*

THE SIMPSONS

As defined in §A, international students are those who would need a visa to study in the US. In most cases, **F-1** is the main visa needed to study full-time at an accredited institution. Here are some key points about F-1:

- **Employment:** You are allowed to work on-campus for up to **20 hours per week during the academic year** (because you still need to take classes) and **full-time** (typically 40 hrs) during official school breaks (e.g., summer and winter breaks). Off-campus employment requires authorization, which can be obtained through CPT and OPT programs described below.
- **Curricular Practical Training (CPT):** CPT allows you to participate in internships or practical training that is an integral part of their academic curriculum. CPT must be related to your field of study and can be full-time or part-time. It requires prior authorization from your university and must be completed before graduation.
- **Optional Practical Training (OPT):** OPT provides up to 12 months of work authorization for students before or after completing their degree. For students in STEM fields, there is an additional 24-month extension available. OPT requires prior application and approval from USCIS.
- **Full-time Enrollment:** You must maintain full-time enrollment status during the academic year. This means taking a minimum number of credits each semester, as defined by your program. Dropping below full-time status can result in loss of visa status.

THE F-1 STUDENT VISA PROCESS EXPLAINED

WWW.PHDCOMICS.COM

JORGE CHAM © 2008

B.1 For Spouses and Children

The spouses and children of F-1 visa holders can enter the US under the F-2 visa status. The F-2 visa allows family members to live in the US with the following conditions:

For Spouse:

- **Work Restrictions:** F-2 spouses are not permitted to work in the US.
- **Education:** They can study part-time but cannot enroll in full-time degree programs.

For Children:

- **Education:** F-2 children can attend K-12 schools but cannot pursue higher education full-time.
- **Work Restrictions:** Like F-2 spouses, children are not allowed to work under any circumstances.

F-2 visa holders must leave the US if the primary F-1 student visa holder loses status or completes their program.

Appendix C

Domestic Students

*“I’m not a bad guy! I work hard,
and I love my kids. So why
should I spend half my Sunday
hearing about how I’m going to
Hell?”*

THE SIMPSONS

Most of what is written in this handbook applies to both domestic¹ and international students. However, there are some differences and benefits that domestic students should be aware of and can leverage to improve their chances of admission.

Standing out §11.3 There are *few* domestic applications compared to international ones, i.e., domestic students are the minority in the CS PhD application pool. Many US universities want to increase the number of domestic students in their programs (and as mentioned later, there are specific fellowships and funding for domestic students). That makes you stand out and can help your case.

Fee Waiving §2.5 Some schools might offer application fee waivers for domestic students. You should check with the school you’re applying to.

School §6 Adcom already knows about your school, which is a plus. You are also more familiar with the US education system and academic culture (§G).

Standard Tests §7 You do not need to take TOEFL or IELTS because you already did your undergrad (or MS) at a US university. You might also be more comfortable communicating in English, e.g., contacting professors (§14.5).

¹As mentioned in §A, domestic means you do not require a visa to study in the US.

Transcripts You do not need to get your transcripts evaluated/translated (which can be a hassle and inaccurate). You can just send your official transcripts directly to the school you're applying to.

Funding §12 You have more opportunities for funding, e.g., through government scholarships for US citizens and permanent residents. You can also apply to specific programs *before* you start your PhD, e.g., NSF Graduate Research Fellowship Program (GRFP) and Hertz Foundation Fellowship. These fellowships are very competitive (§F) and can significantly improve your admission chances.

Research Experience §E You might have many opportunities to do research as an undergraduate, e.g., through REUs and internships at your undergrad university. Highlight such experience in your application.

Open House §10 It is easier for you to attend open house events in person. This can help you make a better decision on which school to attend.

Appendix D

MS Admission

While both MS and PhD programs are graduate degrees, they are *very different* in terms of objective, admission requirements, course requirements, duration, and funding. This section discusses the differences and provides guidance on applying to MS programs.

D.1 Differences between PhD and MS

[Tab. D.1](#) summarizes the main differences between MS and PhD programs:

- Objective: an MS is typically to prepare you for *industry*, while a PhD is to prepare you for research and academia. Some MS has thesis option but in general research is not a focus in MS programs.
- Admission requirements ([§D.2](#)): MS also requires a good GPA, LoRs, SOP, and test scores, but research experience is not required. PhD requires all of these, but research experience is a must.
- Course requirements: MS has a specific number of courses that typically can be done in 2 years. You graduate with an MS when you're done with the courses. PhD also has coursework requirements, which are typically taken in your first 2

Tab. D.1: MS vs. PhD

	MS	PhD
Objective	Industry	Research
Admission Req	No research experience	Research experience
Coursework Req	Yes	Yes (but research is much more important)
Duration	2 years	5–7 years
Adviser Req	No	Yes
Funding	No	Yes

years (§1.2). However, after (and also during) coursework, you focus mainly on research. You graduate with a PhD when you have done enough research and written a dissertation, which usually takes much longer time than coursework.

- Duration: an MS typically takes 2 years while a PhD takes 5–7 years (or even longer). Many students get an MS along the way to a PhD, e.g., after finishing the 2-year course work.
- Adviser: MS students typically do not have an adviser (if you do thesis option then you will have one), while PhD students need an adviser who guides them in their research.
- Funding: MS is typically *not funded*, while PhD is (§12). See §D.2.3 for more details on MS funding.

D.2 MS Admission

In most cases MS CS programs are much less competitive than PhD programs, i.e., you're likely to get in if you can afford it. Many think of MS programs as a *cash cow* because students are often not funded and have to pay tuition.

While admission requirements are similar to PhD programs (e.g., GPA, SOP, LORs), research is not a focus in MS programs. In most cases, the main requirements are that you have sufficient background in CS, e.g., through your undergrad degree. This does not mean MS programs are easy to get admitted, but the requirements are much lower compared to PhD programs.

D.2.1 Admission Committee

MS admission also involves an adcom that reviews applications and makes admission decisions. However, MS admission is typically rolling, i.e., they review applications as they come in and make decisions throughout the admission cycle. Moreover, unlike PhD that has multiple reviewers for each application, an MS application typically involves only one reviewer and does require much time to review compared to a PhD application (§15.2).

Vu: Mason has a very large the number of MS students in CS (1000+ MS vs 200 PhDs). In contrast, other similar size universities often have much smaller MS CS programs (or none). Location plays an important role as GMU is close to DC with many developer professionals who want to get an MS, which are often covered by their employers. Our MS program is geared towards working professionals, e.g., all of our MS courses are offered in the evening and online.

The CS department has three separate committees for MS admission: MS in CS (the traditional one, which is the largest), MS in Software Engineering (SWE), and MS in Information System. Each committee has its own chair and members. For example, I am often in the MS SWE adcom, which has about 3 adcom members (including the chair who also does the review).

D.2.2 Application Materials

You will submit similar materials as in a PhD application, e.g., transcripts, LoRs, SOP, and test scores. However, research experience is not required, and LoRs can be from anyone who can speak about your academic or working abilities. Moreover, your SOP should focus on your academic and work background, why you want to get an MS, and how the program fits your goals. As with PhDs, GREs are often not required. Some MS programs do not even require LoRs or SOPs.

Undergrad Background and GPA Since research is not required, your undergrad background is more important in an MS application. You should have a strong background in CS, e.g., through your undergrad degree. GPA is also important, as it is often used as a filter for MS applications.

SOP Your SOP should explain why you want to get an MS, how the program fits your goals, and why you're a good fit for the program. You don't need to mention about working with specific professors unless you want to do a thesis option. You still need to customize it for each school (e.g., you picked GMU due to its strong SWE program or the DC area has many job opportunities).

LoRs Unlike PhDs, your LoRs do not need to be from professors or talk about research experience. Many MS programs do not even require LoRs.

Test Scores Unlike PhDs, which often do not require GREs, MS programs often require GREs. However, some schools do make them optional, and you should check with the school you're applying to. If you have a low GPA, a high GRE score can help offset that.

As with PhD, English proficiency tests (TOEFL/IELTS) are required for international students (but just passing the minimum requirement is often enough [§7.2](#)).

Note that just as with PhD, English tests are waived if you did your undergrad at a US university.

D.2.3 Funding

Unlike PhD programs, which often have funding (§12), MS students are typically *not* funded. This is because MS students do not focus on research and thus are not funded through RA and PhD students have priority for TA positions.

RA Profs. are not willing to take MS students as RAs because they are not around long enough to be productive. It can take a while for a student to get used to research and start being productive, and by that time (1–2 years), they are about to graduate. Moreover, the goal of most MS students is to get a job, not to do research, so they are not as motivated to do research.

TA MS students are typically not given TA positions because PhDs are given priority as they will stay much longer (§1.2). Many depts. do not have enough TAs for PhD students and so they cannot afford to give them to MS students.

D.2.4 Exceptions

While MS students are typically not funded and do not focus on research, there are always exceptions. Some MS programs are fully funded, e.g., those that are research-oriented and have a strong research component. Moreover, some schools have TAs for MS students, and you can apply for these positions. For example, Mason CS has quite a few TAs for MS students, and my courses in the past two years have MS TAs. Finally, if you have a strong background and can demonstrate that you can be productive in research, then a prof. might be willing to take you as their RA. Some of these students convert to PhD students after having this research experience.

D.3 Selecting and Ranking Schools

Because of the differences between MS and PhD programs (§D.1), you should consider different factors when selecting and ranking MS programs. For example, you might want to consider factors such as location, industry connections, and job placement instead of research areas and advisers (§13).

- **Location:** In addition to living in a place you like (e.g., warm weather, historical city, etc.), you should also consider the job opportunities in the area. For tech industry, consider MS programs in tech hubs like the Bay Area and Seattle. For government jobs, look at schools in the DC area. For example, many students at Mason work for the government or defense contractors in the DC area and take classes in the evening or online.

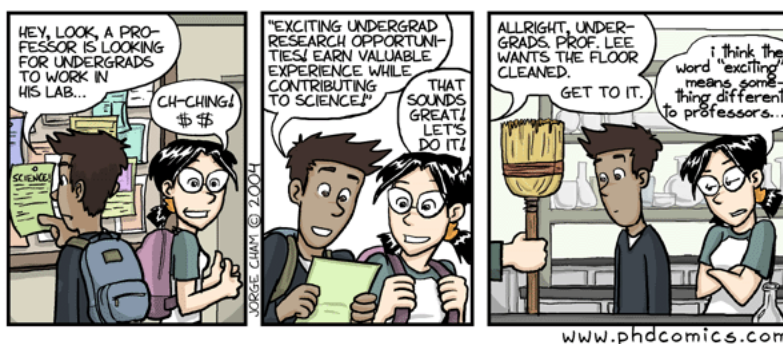

- **Industry Connections:** Universities often have strong connections with local companies and can help you get internships and jobs. For example, Microsoft and Amazon look for students in the Washington area while Google and Facebook recruit those in the Bay Area. Many students naturally get jobs from the government, defense contractors, and Amazon, whose 2nd HQ is in Arlington.
- **Ranking:** Unlike PhD programs where the adviser and research are likely the most important factor, in MS programs the ranking of the school is typically more important. Thus, you should consider the ranking of the school in CS, especially in the specific area you're interested in. For example, if you're interested in software engineering, you might want to consider schools with strong SWE programs.
- **Living Cost:** MS students are typically not funded ([§D.2.3](#)), so living cost can be a big factor. You should consider the tuition and living expenses of the area. Note that sometimes living costs, e.g., renting, seem scary at first but students often find way to make it work, e.g., by sharing an apartment with other students.

Appendix E

Research Opportunities

“Kids, you tried your best and you failed miserably. The lesson is: never try.”

THE SIMPSONS

As discussed in §4, having a successful research experience can greatly strengthen a PhD application. Research experience gives you opportunities to try out research, determine what research area you’re interested in, publish papers (§4), connect with researchers, and get strong LoRs (§3). This section provides some guidance on how to gain research experience as an undergraduate student or student at a smaller college where research opportunities might be limited.

E.1 Locally

Start looking for research opportunities at your institution. If you did well or liked a class, you can check with the professor of that class for research opportunities. You can also go to the department directory and then professors’ websites and see

if they are looking for undergraduate researchers. Even if they say they are looking for graduate students, you can still contact them and ask.

Many universities have programs to encourage undergraduate research. For example, Mason has the OSCAR program, UNL has UCARE, and NSF has REUs (for US citizens and permanent residents).

You can also take honor thesis or independent study courses with a professor. This is a good way to get research experience and also get a LoR from the professor. You can also ask your academic adviser or other faculty members for suggestions. Finally, you can also ask your peers who are already doing research. Use the method described in §14.5 to contact professors

Vu: I enjoy working with undergrads (e.g., I have mentored over 15 undergrads) and always actively recruit. I often get undergraduate researchers through my classes, e.g., asking students who did well in my class if they are interested in research. Occasionally I was introduced to students by other students or faculty.

While most undergrads are understandably not super productive in research, some are and I have published multiple papers with them. I also have written strong LoRs for them and have helped them get into good PhD programs.

At Mason we pay undergrads about \$15/hr and about 10 hrs/week. This is flexible and can be increased as needed.

E.2 Open Source Contributions

Places such as GitHub offer many research opportunities, even though they might not appear so (e.g., they do not explicitly mention research). In many cases, professors or research labs put their projects on GitHub. For example, my research group, [Dynaroars](#), has many open-source projects that undergrads can contribute to.

By contributing code, fixing bugs, implementing new features, or providing documentation, students can gain practical research experience and interact with experienced developers and researchers in the field. Not only you gain research experience, but you might be able to get a LoR from the project maintainer, and you should write about this experience in your SOP (§5.)

E.3 Virtual Research Opportunities

This is less common but several places offer virtual internships and research programs aimed at providing hands-on research experience. These programs often involve working remotely under the guidance of experienced mentors and collaborating with a team of fellow researchers. For instance, [UIUC+ Summer Undergraduate Research in Software Engineering](#) offers an unpaid remote internship for software engineering

students all over the world to collaborate with mentors from University of Illinois at Urbana Champaign.

Appendix F

Fellowship Applications

Having an external and major fellowship can significantly relieve the financial burden of your PhD and improve your chances of getting into a good PhD program (§12.2). Among the most prestigious fellowships for CS PhD students who are US citizens or permanent residents are the National Science Foundation Graduate Research Fellowship Program (NSF GRFP) and the Department of Defense National Defense Science and Engineering Graduate Fellowship (DoD NDSEG). These fellowships provide multiple years of full financial support, which includes a stipend and tuition.

The [GRFP](#) and [NDSEG](#) websites have detailed information on the application process and eligibility requirements. This section focuses on how your application is evaluated and tips on improving it. Note that while these are specific GRFP and NDSEG, the general advice can be applied to other major fellowships (those for non-US citizens or permanent residents).

F.1 NSF GRFP

The NSF GRFP is a prestigious fellowship for US citizens, nationals, and permanent residents who are in the early stages of their graduate study in STEM fields, including both MS and PhD students. The GRFP is highly competitive, with many applicants from top schools, with strong LoRs and research experience.

F.1.1 How Applications are Evaluated

- Each applicant is assigned to *about 3 reviewers* who have expertise in the applicant's research topics. This means reviewers can be quite knowledgeable in your field and your work, your LoR writers and their work, and thus can evaluate your application quite in depth. This is different from PhD applications where adcom reviewers (§2.1) might not be in your field.

Note that if sometimes an original reviewer is no longer available then someone who is not in the field might review your application. Thus you want to make your statements accessible to a general CS audience.

- Reviewers typically try to compare applicants *within their cohort level*. This means that we do not compare an undergrad, who is still applying to grad school, to a 2nd year PhD student who already has an adviser and published multiple papers. This ensures that each applicant is evaluated fairly based on their level.
- Unlike CS PhD applications that focus on research potentials in which papers, research experience, and LoRs are important, NSF GRFP looks at both *research potential* and *broader impacts*, e.g., how you can help society, how you can mentor others, etc. It is not expected that you have published papers or have a lot of research experience (recall that MS students can also get the fellowship). Instead, you need to convince the reviewers that you have the potential to be a good researcher (technical merits) and that you can help society (broader impacts). More in §F.1.2.

F.1.2 Intellectual Merit and Broader Impacts

Your application will be evaluated based on two criteria: Intellectual Merit (IM) and Broader Impacts (BI).

Intellectual merit (IM) IM evaluates your research potential, e.g., your research experience, your potential to do research, and how you can contribute to the field. Unlike a normal project or research proposal, in which the evaluation is entirely based on the merits of the proposed work, in the GRFP, the evaluation is *not* entirely about the research plan. Reviewers are repeatedly reminded to not focus too much on the research plan as many applicants are still applying for PhD programs and might not even get into the field or work with a prof. that fit their research plan.

Instead, the evaluation is based on your *potential* of being a good researcher using various criteria, e.g., your research experience, what others think of you (LoRs), research plan, etc. This also means that even if you have very little research experience, you can still get the fellowship if you can convince the reviewers that you have the potential to be a good researcher. Vice versa, if you have a lot of research experience and in very top places but cannot convince the reviewers that you have the potential to be a good researcher, you will not get the fellowship.

Broader impacts (BM) BM is a common and important component in NSF application. It is about how you and your research can *benefit society*. Many students just mention how their research is cross-discipline and thus has broader impacts (e.g., improve software quality and thus help society). This is too common and not enough.

You also want to talk about how you, as a grad student with your research, can help society, e.g., through outreach, mentoring, etc. As mentioned below, you will want to be specific and concrete, e.g., “*I will work with highschool students ..*” is not as convincing as “*I have had experience in mentoring highschool students X and will continue to do so through Y,Z ...*”.

Writing BM is often difficult, not only for students but also new faculty. You should ask someone who has experience writing NSF proposals to review your BM.

F.1.3 Common Pitfalls and Tips

These are common pitfalls that many applicants make in their GRFP applications and tips on how to avoid them.

- **Too Technical or Narrow.** Remember that you’re writing to a general audience in CS, not experts in your field. While NSF tries to match reviewers with your field, CS fields are simply too broad and you might get a reviewer in the field but not in your specific area or familiar with the problem you’re working on. So avoid technical jargon and explain things in simple terms. If the reviewer cannot understand your research plan, they will likely give you a low score.

You should ask your professor or someone who’s familiar with writing NSF proposals to review what you wrote. They can tell you if it is too technical or narrow and help you improve it.

- **Preliminary Work.** Your research plan should have some preliminary work to convince reviewers that you have thought about the problem and have some initial promising results. It does not have to a lot, e.g., you don’t need published results or an implementation, a small experiment done by hand on some small examples would suffice. Moreover, it should be concrete and convincing, e.g., “*When being applied to the program in Fig 1. of the paper published PLDI’19 that approach X failed, my idea worked and was able to ...*”. This will set you apart from others who just have a plan but no results.
- **Related Work and Challenges.** Many research plans motivate the problem well but do not discuss limitations of existing work, making it questionable if the problem is important or if you are aware of the challenges. Thus, you should do a thorough literature review and discuss what people have done and their limitations. Your research plan should then talk about how you plan to address these limitations, i.e., fill the gap in the literature.
- **Do not BS.** Many research plans include technical details or proposed work that are vague, unrealistic, or even impossible. This is similar to a student taking an exam and write a lot of nonsense and hope for partial credits. As mentioned, reviewers are often chosen based on their expertise in your field

and can detect B.S. Again, do your homework and ask someone who knows the field, e.g., your advisor or LoR writer, to review your research plan.

- **Overexaggeration Lors.** Many GRFP applicants have LoRs from professors that are very good at writing. However, they often use flowery language and completely overrate their students. Reviewers can sense this overexaggeration and might not trust the LoRs. This is similar to overclaiming research contributions when writing papers. So you should mention this to your LoR writers so that they can tone down the language and be specific with concrete examples to demonstrate why you're *"the best"*.

F.2 DoD NDSEG

The NDSEG is another prestigious fellowship supporting *U.S. citizens* pursuing advanced degrees in STEM fields *critical to national defense* (such as CS). NDSEG has several differences from NSF GRFP, e.g., it redacts more information from the reviewers and focuses more on application to DoD.

F.2.1 Evaluation

Redacted info. Unlike the NSF GRFP, reviewers only see *redacted versions* of your submitted materials (applicants are asked to provide full and redacted versions of your research plan, CV, and other materials). Thus, we do not know what schools you went to, where you did your internships, your publications or research experience. We also *do not* see your LoRs, i.e., we do not know who wrote them or what they wrote.

Reviewers mainly get to know you and evaluate your application by reading your research plan and personal essays. This is for *fairness and avoiding bias* based on the school you went to, places you published at, your LoR writers, etc. Nonetheless, I felt I am missing too much information. However, it could be that external reviewers like myself help with the first cut based on the redacted materials, and then there are internal reviewers who makes the final decision based on the full materials.

Non-expert NDSEG reviewers hold advanced degrees in STEM fields. However, NDSEG reviewers are more general and might not be in your specific field. For example, in GRFP I mostly review applications in PL and FM, while in NDSEG it seems that I review applications in all areas of CS and even non-CS. Thus, you should make your research plan *more accessible to a general audience*.

Vu: I find it a bit difficult to evaluate NDSEG applications because I do not have the full picture. For example, a student mentioned that they have published in the topic they proposed but redacted all information about the publication, so I have no idea where they published, what the paper is about, etc. It is also difficult to evaluate the academic background of the student, e.g., some student just started grad school and so their transcript is essentially blank. It is also annoying to see CVs with so many blanked out information. They might as well should just submit a blank CV one.

In the beginning I find it surprising that I don't get to see the LoRs, but I understand the reasoning behind it and gradually think it is a good idea. As mentioned above, LoR writers for NSF GRFP (§F.1.3), especially those from top schools, often overrate their students and thus can bias the evaluation. So I don't find I am missing much by not seeing the LoRs.

F.2.2 Common Pitfalls and Tips

These are some common pitfalls I see in NDSEG applications and some tips to avoid them. Some of these are similar to NSF GRFP (§F.1.3) while some are specific to NDSEG.

- **Customize your research to DoD**, e.g., through specific project from DARPA or ONR. Make this prominent, e.g., in the introduction or in its own section. This is different from NSF GRFP where you want broader impacts to society.
- **Unclear research plan.** You should aim to have (i) clear problem statement, (ii) why it is important (esp. to DoD), (iii) what has been done and their challenges/limitations, and (iv) what you plan to do to address the challenges. Moreover, research is often quite technical and ambitious, so you want to show some preliminary work, e.g., a small experiment by hand on some small examples, to convince reviewers that you have thought about the problem and have some initial results.

Unlike GRFP where we have more things to evaluate, in NDSEG we mainly evaluate you based on your personally essays and especially research plan. So you should do proper research on what you propose and make it clear and convincing.

- **Personal stories and essays should be unique and interesting.** Many essays and stories I read are quite generic and do not tell much about the student. For example, being an URM, involving in a robotics club or mentoring underrepresented students are quite common and do not tell much.

You should pick a few thing and provide concrete examples and details. For example, provide a concrete experience in being minority and how it has affected you, talk about what you have accomplished in your robotics club, e.g.,

you built a robot that won a competition, or you mentored a specific URM student who then went on to do great things. Just a small, interesting detail can make your essay stand out.

- **Not using all allowed pages.** Many research plans use only 1/2 or 2/3 of the number of allowed pages, which themselves are already quite short. Such documents are often not detailed enough and do not provide enough information for reviewers to understand and evaluate the research plan. So use all allowed pages to provide enough details about your research plan. This is especially important as we do not know much about you due to redacted materials.

F.3 Common Tips for Both Fellowships

- **Use LaTeX to write your research plan and essays.** This is the standard in CS and engineering and will make your application look more professional. Moreover, do not use the default Word settings, e.g., left justification, as it is not standard in CS and engineering and difficult to read.
- **Ask your LoR writers and adviser to look at your writing/essays.** You are new to the field and research writing, and your ideas might not be accurate or have already been explored. It's better that they tell you now than for you to find out later from reviewers.

Appendix G

Academic and Cultural Differences

*“As intelligent as you are, you
have to learn to appreciate other
points of view.”*

THE SIMPSONS

This section lists some general academic and cultural issues that students, especially international ones, might want to pay attention to.

G.1 Academic Integrity (Cheating and Plagiarism)

Plagiarism and cheating (e.g., exams and assignments) are a BIG no-no in the US. If you're caught cheating, you will face serious consequences and likely be expelled from the university (e.g., after the second time at Mason). This is quite different from many international countries where cheating is common and often tolerated. Faculty is extremely good at detecting cheating (we have been dealing with these situations so many times over so many years), and *will* report cheating cases. In short, whatever you do, don't cheat—not worth it.

Here are the typical steps: (i) a faculty suspecting a cheating case will report it to the Office of Academic Integrity (OAI) at the university—the report often has supporting evidence, e.g., a copy of the exam or assignment; (ii) OAI will investigate the case, e.g., by interviewing the student and faculty, and checking the evidence; (iii) OAI will make a decision, e.g., whether the student is guilty or not; and (iv) if guilty, OAI will decide on the punishment, e.g., a failing grade for the assignment or exam, a failing grade for the course, or even expulsion from the university, especially for repeat offenders.

So after receiving the report from your prof., OAI *completely* takes over and makes its decision. This means begging your professor will not help because they simply are no longer involved in the case and cannot do anything.

G.2 Illegal Software

Using illegal/cracked software is very common in many countries (and even in the US). However, *do not* install or use them on university computers, even those given to you by your adviser. It is unlikely that the university will track you down, but it is the *software company* that will. They have very sophisticated tools to detect illegal software and will sue your university/department. Imagine your department or adviser being sued for a large sum of money, and it is *you* who caused it. If you need to purchase software, ask your adviser or the department (§10.3).

G.3 Costly Gifts

In many countries, it is customary to give professors costly gifts (e.g., expensive liquors, jewelry, or even money), often during the holidays, to show respect and appreciation. In the US, this can be considered *inappropriate* and discouraged.

However, if you'd like to offer small souvenir-like tokens, it's a thoughtful gesture that's appreciated. Some professors proudly display their gifts, which can come from students and colleagues (e.g., when they travel to their home countries or conferences). In summary, small gifts are fine, but avoid anything that might make your professors uncomfortable.

G.4 Maintaining Good Relationships with your Profs.

There's a misconception that in the US it's all business, with professors as bosses who pay students for their work and that lab mates are just work colleagues; and that doing nice things means expecting something in return.

However, the reality is quite the opposite. While people can be straightforward and appear "cold", they are also informal, friendly, and very caring (in ways that might surprise you). With lab mates and colleagues, you will often work and go to lunch together, confide in each other, help each other navigate the academic journey, and often become lifelong friends. With your professor(s), you can call them by their first name (§15.4), disagree with them and argue (and gain respect doing so), seek their help (even on personal matters), come to their houses for parties or gathering (e.g., my lab always come to my house for [Thanksgiving](#)), and give them small thoughtful gifts that they put on their desks (§G.3). Many people maintain lifelong relationships with their professors and colleagues, staying in touch through cards, emails, and visits, even after they no longer work together.

Vu: I maintain a close relationship with my former professors and mentors. When there is a new event in my life (or theirs), I often email them or call them, e.g., when I get married, have a new baby, new job, etc. When I was having issues at UNL and considering leaving, I talked to my PhD advisers Deepak and Steph. I think this does not bother them a bit; they are genuinely interested in knowing and helping solve these “dramas” in my life.

I also visit my former professors when I am in their area. I meet Thang Bui (my MS adviser) at least once a year when I come back to Harrisburg to visit my parents. When Steph was in DC for a meeting, I invited her to give a research talk at Mason. I have also collaborated with them after I graduated e.g., I recently got an NSF grant with Deepak.

In short, while I am a bit closer to my former advisers and mentors than most people (e.g., I still keep in touch with my middle school teacher in Hawaii), it is always a good idea to maintain a good relationship with people who have helped or worked well with you. A simple, short email or text once in a while (e.g., a “*Hi X, I heard you just got promoted ... Congrats!*”) would suffice. They will appreciate it, and you never know when you might need their help.

G.5 Miscs

Several other common surprises for international students (and foreigners in general) in the US. Note that I skip topics involving politics, religion, tax, and racism as these happen in many countries and are not unique to the US.

Small talks People often engage in small talks, e.g., about the weather, sports, or weekend plans. This is a way to start a conversation and how social interaction starts in the US.

Moreover, avoid asking personal questions, e.g., about salary, age, relationship status, or health, as these are considered private. Talking about kids’ activities or schools are OK. Also, do not talk about politics or religion. In fact, we often do not talk about these taboo subjects with our family and friends to avoid conflicts.

Sometimes foreigners are surprised by how Americans do not talk about their personal lives, e.g., sharing details about their families, health, or relationships, and that their conversations are often not very “deep” or “mind-provoking”. This is just a cultural norm about privacy and personal space.

Healthcare System You (and your spouse) will need health insurance! Otherwise you will be charged a lot for healthcare services when you need them. However, as mentioned in §12, your TA/RA (and fellowships) will cover health insurance. Your spouse/children also get health insurance or significant discounts under your plan.

Note that even with insurance, healthcare services might still be expensive. So you should know what your insurance covers and be prepared for unexpected costs. Moreover, healthcare system has many confusing jargons such as HMO, PPO, deductibles, co-pays, and coinsurance (try take a look at the Explanation of Benefits or EoB statement you received from your insurance company). It's arguably the most complicated system in the US and even Americans often do not understand it (and politicians often exploit this to their advantage). Do not hesitate to ask your HR or the insurance company for help.

Tipping Culture Unlike many other countries, tipping is expected for various services, especially in restaurant. So adding an extra 15–20% to your bills is common, especially in restaurants.

You should also tip for other services, e.g., Uber, taxi, haircuts, and hotel services. The minimum wage for tipped employees is lower than the standard minimum wage, so tips are an important part of their income.

Car Dependency Most places in the US are highly car-dependent. If you do not have a car, you will need to rely on friends, Uber, or public transportation, which can be inconvenient and time-consuming. Many international students end up getting a driver's license, which is highly convenient and replaces many documents (e.g., ID, passport) and buying a car.

These are considered private and should not be asked. Also, do not talk about politics or religion in general (in fact, we do not even talk about these with our family and friends to avoid conflicts).

Appendix I

History and Acknowledgement

History This book was conceived during a lunch with a faculty at Mason. We talked about why Mason was not able to attract good Vietnamese and other international students, despite having a much stronger CS program than many schools that these students want to go to (part of the reason is described in §13.1.2). We wish there were a way for international students to know about PhD programs in the US.

I was also a member of the large VietPhD group on Facebook and often browse Internet forums (e.g., [Reddit/gradadmission](#) and [GradCafe](#)). There I saw many questions from students about PhD programs. However, most participants are students, many of whom in non-CS fields or not in the US, and their answers are typically not accurate and often lead to more confusion. So I thought it would be useful to have a handbook that is specific to CS PhD programs in the US from an insider perspective.

I started writing this book in May 2023 and have been updating it since then (mostly around deadline time when I procrastinate, i.e., *productive procrastination!*). The book was initially intended for international students but has been updated to include domestic students (§C and §F). The book is open-source and available on [GitHub](#) so that others can contribute to it.

About Me I am an associate professor in the CS dept at George Mason University (Mason). Before Mason, I was at the University of Nebraska-Lincoln (UNL). Both UNL and Mason are large R1 research universities in the US and have many international students in their CS graduate programs. My personal and lab website is at dynaroars.github.io.

I have been involved the PhD admission process at Mason and UNL for many years. This allows me to have a good understanding of the process, the challenges students face, and what faculty are looking for. Currently I am the program director of the MS program in Software Engineering at Mason (thus also have experience with MS admission—which is quite different than PhD as discussed in §D). I also have

served in the panels of PhD fellowships including NSF GRFP and DoD NDSEG, which allows me to provide some insights on external fellowship applications (§F).

Though I was not an international student, many of my students and collaborators are/were. I also mentor students from Vietnam and have close colleagues and friends who were once international students. I hope to capture the diverse challenges and experiences they've faced in this book so that it can be a valuable resource for prospective international students. Finally, my upbringing in the US provides a perspective aligned with American culture, allowing me to shed light on various issues, particularly those related to cultural differences (§G).

Acknowledgement Many people have contributed to this work. Profs. Craig Yu (Mason), Hakan Aydin (Mason), Xiaokuan Zhang (Mason), Hung Le (UMass), and Deepak Kapur (UNM) provided valuable input in the early version. Other Mason faculty members also have provided feedback and contributions. Many students including Didier (Mason), Thanh (Melbourne), and Dat (Melbourne) have contributed valuable questions and feedback.

Also thanks to NSF for encouraging faculty to be creative in research and education, which allows me to work on this book.
